NEW TOOLING

TRINITY 5660

-PD-

FLOUR POWER

COVERED HOPPER

HO & N SCALE

ORDER ALL 24 NUMBERS TODAY!

The **5660 Pressure Differential (PD) Covered Hopper** was first introduced in 1999, by Thrall Industries, as the latest advancement in the evolution of Pressure Differential Covered Hoppers. Production continues today under the TrinityRail brand, with nearly 4,000 cars already in service. These specialized PD covered hoppers are notably different from traditional "gravity discharge" covered hoppers in both form and function. Designed to transport powdery commodities such as flour and talc, the 5660 PD Covered Hopper features five non-opening bays connected by a master pipe. The cars are unloaded by pressurizing the interior of the car with air, thus blowing the commodity out. An icon of today's railroading, the Trinity 5660 PD Covered Hopper is perfect for your modern layout! **Coming in HO & N**, collect all 24 numbers by ordering now through your favorite dealer or direct!

ASSISTANT EDITOR

editorial

DON HANLEY

BACK TO THE LAYOUT

SEPTEMBER IS GENERALLY CONSIDERED THE

month that summer ends. Kids go back to school, football season begins, TV shows pick up where they ended last season, and most vacations are over. There seems to be something in the North American psyche that says: *It is time to get back to work, play time is over.*

With summer ending, what are your hobby plans? Do you have a plan of action for the hobby? More often than not, our “plans” to do this or that are little more than daydreams.

How often do we say “I am going to fix this, or rework that section of track that causes us headaches.” But at the end of a busy day at work, we want to eat dinner with the family and watch a little TV. Before you know it, the evening is gone and you haven’t done anything. I’m guilty as charged.

Maybe we’re just armchair modelers at heart? There is nothing wrong with that – just be honest with yourself. But if you are like me and building the layout is important, how do you get yourself to work on it?

ASSISTANT EDITOR'S THOUGHTS | 2

How do we get out of the rut?

First, it is important to figure out *why* we are not working on the layout. It could be boredom or a phase of construction that we don't enjoy. Maybe we're stuck at a technical issue, or working on a section of layout that requires contortions the body rebels against. Whatever it is, identify it.

With the cause identified, I next devise several solutions or different courses of action and *write them down*. I recommend several because the first idea may not be the best. Talk to fellow hobbyists and get their input. Also talk to friends not involved with the hobby. They have no preconceived ideas about modeling that can limit suggestions.

"Getting Real" columnist Mike Rose didn't like the operations on his layout and took the extreme position rebuilding large

ASSISTANT EDITOR'S THOUGHTS | 3

portions of it. Mike took the time off from running trains to figure out what was wrong, asked for input, and then developed a plan for making changes, see mrhpub.com/2015-07-jul/port/files/71.html and mrhpub.com/2015-08-aug/port/files/73.html.

The deadline of the NMRA convention spurred Publisher Joe Fugate back to work on a layout that had been mothballed for three years. He took the time to determine what needed to be done and prioritized items to be worked on. See mrhpub.com/2015-02-feb/port/files/11.html.

But what if you don't have a deadline or some compelling reason to get you working on the layout. What can you do then?

I am a firm believer in writing down goals. Once it is down on paper as a goal, it moves from wishful thinking to something

ASSISTANT EDITOR'S THOUGHTS | 4

tangible. Once it is written, a plan of action can be developed. The action plan does not need to be detailed, but it should contain key elements of what is needed to complete the stated goal.

Once the goal has been established, create a deadline for yourself and write it down. Why? Unless there is a written deadline it is just like an unwritten goal -- wishful thinking. If you don't meet your self-imposed deadline, so what? You are still further along than if you hadn't done anything. Just write a new deadline.

I understand many of us will not take the time to practice this exercise. Some of you might think it's a waste of time. Consider this: In 1979 new Harvard MBA graduates were asked a simple question "Have you set clear, written goals for your future and made plans to accomplish them?"

- 84% had no specific goals
- 13% had goals but they were not committed to paper
- 3% had clear, written goals and plans to accomplish them

Ten years later the graduates were interviewed again. The results?

- The 13% of the class who had goals were earning, on average twice as much as the 84% who had no goals
- The 3% who had clear, written goals were earning on average 10 times as much as the other 97% combined.

See sidsavara.com/personal-productivity/why-3-of-harvard-mbas-make-ten-times-as-much-as-the-other-97-combined

So, are written goals important? I think so. Will they help you make progress on your layout? I believe they will.

ASSISTANT EDITOR | 5

I will leave you with this quote from Mark McCormack: "If you don't have time to write down your goals, where are you going to find time to accomplish them?"

MRH CONTEST: THE "ONE MODULE" CHALLENGE

GOAL: Design the first "module section" for a sectional home layout design.

Hypothetical room is 12' x 15'

NOTE: This is a sectional home layout design, *no modular standard* required.

CONTEST RULES

ENTRY DEADLINE: January 31, 2016

- Module must be 18"-24" in depth and 60"-84" in length.
- Scale: Z, N, TT, HO, S, O - standard and/or narrow gauges.
- Connectable to a flattop staging section (or additional layout sections later) at each end. Design the two flattop staging yards with 3 to 8 staging tracks of at least 70" long.
- Rough out the outlines of the other layout module sections to be built for the entire room. No track plan needed, just an outline of the modules in the room is sufficient.
- Describe the theme, era (if any), and rationale for the module and its place in the layout that would eventually fill the room.
- Can follow a specific module standard (like Free-Mo) if desired, but that is not a requirement. Each module can be custom and only mate with an adjacent module.
- Module support method and height is up to you, but please describe it.
- Must be wired for either DC or DCC. Describe how you would interconnect the wiring.
- As the first module of a sectional home layout design, making the module removable once completed is not required, but innovation here will get extra points.
- As to construction methods & materials, surprise us. Extra points awarded for innovation.
- Include pricing for the module. There's no need to build it, this is a design contest. This includes module benchwork, legs, backdrop, roadbed, trackwork, wiring, scenery materials, structures, and details. Do not include a DCC system, rolling stock, or locos.
- The best submissions will be published, so extra points will be awarded for high quality text, illustrations, photos, and captions. Winners will get a bonus payment rate.

STAFF NOTES

[Click here for reader comments](#)

"ONE MODULE" CHALLENGE CONTEST ... AND MORE

WE'RE KICKING OFF A NEW CONTEST THIS ISSUE:

the "One Module" Challenge Contest. In a nutshell, this is a contest to design the first module of a home layout that's to be built in separate pieces. These sections do not need to follow any modular standard, although they can if you want.

See the contest announcement to the left for all the details.

One reason we're promoting this contest is to drive home the idea that using sectional methods to design and build a home layout is an excellent approach to the hobby in the 21st century.

It works like this: pick some interesting scene, town, or industry for your layout (called a Layout Design Element or LDE in layout design parlance), and design a single "module" or section around it. We will use the term module below for convenience, but remember, we're referring to a generic layout section, not something following any particular modular standard.

STAFF NOTES | 2

You can build this module at the workbench, likely doing your best work in complete comfort. Need to install turnout motors and wiring underneath? Turn the module over to work on it.

Build this module to a finished state, complete with scenery and structures. Now add flattop staging to each end and run trains!

Flattop staging is nothing more than a 1x12 inch board that's 8 feet long with a small staging yard on it. If you need more length, then add more boards on the end, with more yard tracks that line up with the first board.

Need more layout? Build another module and add it in. To build the entire layout, just keep on adding module sections until you get the whole layout. You can stop any time, and all along the way, you have a finished, operational layout. Completely adaptable layout scope management!

If your space changes, keep the finished modules and redo the connecting pieces. Build as much layout as time and skill allows, all the while having a finished working layout in the layout room. Scale back your plans without any worries once you see what your actual time and abilities allow you to accomplish.

Give it a try! Provide a thumbnail sketch outline for a layout in sections to fit a 12 by 15 foot room. Then design the first module section in detail, price it out, and enter it in the contest. If you have some innovative ideas on how to do lightweight layout module sections, you'll get extra credit for that.

Let's see what you can come up with!

2015 NMRA National Retrospective

As we're writing this, we're just coming off the 2015 NMRA National Convention. It was quite a week, with several MRH

LAST ISSUE'S RATINGS

The five top-rated articles in the [August 2015 issue](#) of *Model Railroad Hobbyist* are:

- 4.6 DCC Impulses: Getting started in DCC
- 4.5 What's Neat: Helicon focus, carving foam, and more
- 4.5 Using Excel to create your employee timetable
- 4.4 Getting Real: Finishing an entire aisle, part 2
- 4.3 Building Meadow Gold dairy

Issue overall: 4.5

STAFF NOTES | 4

staff members showing layouts as well as doing clinics. The week ended with the National Train Show. For MRH, the Train Show saw a steady stream of brisk booth traffic most of the time. We got a host of new subscribers for MRH and for our network TV-quality internet channel, TrainMasters TV.

Publisher Joe Fugate hosted layout tours and an op session. Here's Joe's take on how it went:

"I worked hard getting the layout ready, and the last couple days we had TMTV Exec Producer Barry Silverthorn on hand to shoot the progress of final prep. When Barry didn't have a camera in hand, I put him to work on the layout!

"Barry did some scenery, helped test and tune rolling stock, and debugged operational issues by running lots of trains.

STAFF NOTES | 5

"Barry also shot the Siskiyou Line special convention op session live and we'll be doing that on video, too. We're expecting to debut all this video on TMTV and DVD this January as part of the Siskiyou Line's 25th anniversary in the January 2016 issue of MRH."

Dick was a key player in the late 1970s in the Fort Wayne Railroad Historical Society's rescue and restoration of NKP 765, a 1944 Lima-built 2-8-4. He moved to Oregon and began Oregon Rail Supply in 1989, manufacturing signals and other detail items for the hobby, as well as distributing Accurail products.

In addition, Dick was involved in the restoration and operation of Southern Pacific 4449, and an active member of the Oregon Rail Historical Foundation.

Suzanne Yager would like to say a special thanks to all who assisted her in the National Train Show staffing the booth. If you have any stories you would like to share about Dick, please send them to Suzanne at rpyager@netzero.net

Dick is survived by Suzanne, his wife of 29 years; and his son Rick.

? QUESTIONS AND ANSWERS

Drilling holes for grab irons

Q. I have just spent the last two weeks trying to drill umpteen #79 holes for the grab irons on a Tichy USRA box car kit. Nine broken #79 drill bits later with some bit ends stuck in the hole I was drilling, I am totally frustrated. I have been using my finest twist drill, soaping drill bits and trying to keep the work as steady as possible. What's the secret?

—Ken Adams

A. Geoff Bunza: Drilling tiny holes can be a challenge. Fortunately, soft plastic is about the easiest material to use, if you want to call it easy.

I have never been able to use a motorized drill with #80 and #79 bits with consistent luck. I always use the smallest pin vise I have. Insert the drill bit as far into the pin vise as you can, leaving only enough exposed to make the correct depth hole.

► MRH QUESTIONS, ANSWERS, AND TIPS

MRH Q-A-T | 2

Use a very sharp awl or scribe to mark and start the hole. This creates a dimple in the plastic. For consistent hole patterns like those needed for hand grabs, make a template for the hole spacing. That is, get a piece of plastic or metal, lay out the hole pattern in it, and drill the holes. Align the template on the side of the car with another piece of glued-on plastic to form an L bracket, or tape it in place. Use the scribe or even the drill in the pin vise to start the hole for the grab iron.

I use a lubricant called Boelube (orelube.com/products/liquids) available in liquid, paste, and paste stick from MSC Industrial Supply mscdirect.com and amazon.com. It is the best cutting lubricant for any material that I have ever used.

Drilling with a small drill means you must keep the work steady and the drill vertical. I literally tape the work to my bench or a piece of scrap wood or plastic with blue painters masking tape. With irregular plastic models, this is easier than clamping them in a vise, which would also be ideal. Drill for a

small depth and then remove and clear the flutes of the drill bit. This takes patience and practice. I still break bits from time to time, particularly when I get in a hurry or frustrated with the work.

1. The BLMA grab iron template is etched stainless steel marked for grabs in common sizes from 15 to 24 inches wide.

MRH Q-A-T | 3

Many small bits on the market are just plain junk. A sharp bit is essential. I have purchased “bargain” 60-80-bit sets where many of the bits were dull, new out of the package. They were no bargain at all.

A couple of vendors have sold grab iron templates for ladders [1], but I don’t remember who they are. Practice will improve your efforts with considerably large amounts of patience.

Rob Spangler: I must confess to not being the steadiest with small drills, and I do break a few. What I started doing was to use a slightly oversized drill, maybe up to a #76. The small amount of extra strength helps, and the larger hole diameter disappears once the grabs are glued in.

For more advice and opinions, read the thread at mrhmag.com/node/22681.

Average lifespan of a railroad car?

Q. Can anyone tell me what the average lifespans of the different types of railroad cars are? Box cars, tankers, hoppers etc. My layout is set in the year 2000, and I would like to keep the cars pretty prototypical for the era. I’m thinking that cars from the ’70s would be fine and also ideal for some of the more extreme weathering, but everything I’ve read on the Internet seems to be giving conflicting results of exactly how long cars are in service mandatory retirement. I’m modeling a resurrected shortline on the premise of “what might have been” if they hadn’t gone out of business in the 1970s.

—Stu

A. Conflicting answers on the Internet? Say it ain’t so, Stu!

James Ogden: Short answer, anything since the 1970s goes, basically.

Age of freight cars is dependent on a few things. There are restrictions on age for cars used in interchange service. If a railroad wants to use a freight car in interchange service (moving from one railroad to another, then its life is over at age 50. If the car will stay on home rails, there is no limit. It is actually not uncommon to see older cars in maintenance of way service.

On the BNSF, I did spot a Santa Fe flat car with a build date of 1934. Of course, BNSF is huge, so staying on home rails is pretty easy and still allows a lot of travel for such a car.

Rob Spangler: The typical car in interchange service is subject to a 40-year underframe rule, unless remanufactured for 50-year compliance. There's now a 65-year rule for certain cars.

Any car built from 1960 on would be acceptable for your 2000-era layout. House cars built up to 1966 would have to exhibit revised safety appliances (no running boards, A-end ladders shortened to four rungs, an L-shaped grab iron on the roof at the B end if it retained high-mounted brake wheel and ladders, and a yellow placard stating "keep off roof – no running board").

Weathering on these older cars may not always be as extreme as you'd expect. It was still possible to see examples of paint schemes pre-dating the '70s and '80s mergers which remained more or less intact.

Chris van der Heide: I see tank cars with late -1970s/early -1980s built dates with some regularity. They're not as common, and that's for tanks that haven't been repainted/rebuilt/reweighed, and still have the original "NEW 5-79" etc. marking

2. GLNX 5329, photographed March 29, 2013, has a 12-79 new date: Chris van der Heide photo

visible. I see plenty more which I'm pretty sure are 1970s cars, but don't have the original date marking (and the data in the COTS panel is too small to read in the photographs, or when the train is rolling by at 40 mph).

Cars get repainted, renumbered, re-leased and sold, so that 1970s car design might be totally appropriate for your layout. The paint scheme or car number might not, at least not in its original state – a lot of secondhand cars exist out there in original paint but with all original logos painted over and renumbered for new owners.

Some secondhand cars can be traced using sites like railcar-photos.com and canadianfreightcargallery.ca with detailed

MRH Q-A-T | 6

search features. Don't let the name turn you off – it also includes lots of U.S. equipment. Other sites like rr-fallenflags.org and rrpicturearchives.net also have lots of good material but aren't searchable by car history.

Read all of the answers at mrhmag.com/node/13366.

Paint cork before track?

Q. I'm about ready to put down some cork. The question is, should I paint the cork a base color before the track goes down, or just paint the cork and track together later? This is a yard area with seven tracks on sheet cork. If I paint first, I'm not sure how to transfer the track plan from my paper plan to the cork. May be hard to see on a dark base. I was thinking of using flat black as my base color. Suggestions, experiences, unrelated but funny anecdotes?

—Randy

A. Alan: Glue, track, then paint for me. Same issue – couldn't see centerline tracings if cork was painted first. A light coat of Camo Earth Brown is just a head start on weathering to come later. Rob Spangler will tell you to lay all track and operate the layout before painting, in case track changes are necessary. Good advice for some. I traded scraping a little paint off if need be, in exchange for no voluminous spray-painting in the train room.

Rob Spangler: I don't think you gain anything by painting first. Besides, when you paint the track, it will cover up the initial color on the roadbed anyway.

Tony in Gisborne, Australia: I'm with Alan and Rob. Lay track first, spray-paint it, paint cork on either side of tracks/yard, and spread ground cover, lastly lay ballast.

MRH Q-A-T | 7

Graeme Nitz: Paint all the “ground” first with a “ground” color, then lay the cork and track and paint the cork and track a “track” color.

Alan T.: One exception to the above advice might be under turnouts. Some like to spray the cork with “faux stone” texture paint to avoid having ballast foul the turnouts.

Brendan: I had a similar issue with seeing the lines. I painted mine with latex light gray and then added the lines. I used latex caulk to hold the track down. I have since had to make alterations and I can verify that the track and paint adhered well to the cork. When I pried the track up, the paint came up with the latex caulk and some cork in spots.

Under turnouts, someone showed me a trick where they cut a piece of tuck tape (used for vapor barriers) and stuck it under

MRH Q-A-T | 8

the switch points. He then sprinkled some ballast on top, and shook off the excess. The result was a thin, one-granule-thick layer of ballast that was well under the level of the points and wouldn't interfere. Later, an alcohol/water/glue mix was added for extra adhesion.

See more answers and photos at mrhmag.com/node/22600.

TIPS

Drill bit chart

While working on brake line detailing I frequently had to switch twist drill bit sizes. I became frustrated with trying to guess at what size drill bit to use with each diameter of brass wire. After an Internet search for the drill number/size comparison, I made a chart and taped it to the back of my drill bit case.

I had a feeling that over the years some drill bits were not

MRH Q-A-T | 9

in the correct spot. I removed all of the drill bits and placed them onto a larger printout of the chart. I placed Scotch tape with the sticky side up over the decimal numbers to keep the drill bits from rolling around. I used my digital caliper to measure the drill bits and place them in the proper spot. After all were measured I placed them back into the case.

Now I don't have to guess at drill bit sizes anymore.

—Eric Warhol

Ed: Another way to save time fussing with drill bits is to use several different pin vises, with different bits chucked in them. I find the pin vises at swap meets and rarely pay more than \$5 for a good used one. Three or four are plenty.

3. A little bit of organizing ahead will save valuable modeling time.

PUTTING A BULLNOSE ON THE END OF A BACKDROP ...

IN NOVEMBER THE AUTHORITIES INFORMED me that it would be improper to host a December op session on the Bear Creek & South Jackson. I figured taking an extra month between op sessions would be a good time to complete the peninsula's benchwork and backdrop and install the remaining two miles of mainline. Accordingly, the week after the November 2014 session, my construction crew started the process of demolition and reconstruction.

In my "Up the Creek" column in the July 2014 *MRH* issue (mrh-pub.com/2014-07-jul/land/#22), I wrote about building the peninsula backdrop. I wanted to keep its thickness to a minimum. The 5" thickness required by a 2x4 stud wall could be much better used as space for trains. I built my backdrop out of two layers of 5mm Revolution Ply (from Patriot Lumber) laminated together with construction adhesive. Once the glue set and the clamps

► BUILDING A FREELANCED 1950S ERA LAYOUT

UP THE CREEK | 2

1. The newly completed backdrop runs the length of the Bear Creek & South Jackson's peninsula and really enhances the sense of isolation for train crews, as well as reducing the noise level during an op session. The backdrop is less than 1/2" thick in most places, but I elected to add a bullnose to the end of it. The bullnose looks great and avoids revealing that the sky is only 1/2" thick. It's built out of a cardboard shipping tube glued to a plywood mounting plate.

UP THE CREEK | 3

were removed, it proved to be stiff and straight – the warps and bows in the plywood sheets disappeared. With a thickness of only 3/8" it also left more space for the trains.

However, I didn't like the idea of people at the end of the peninsula being subjected to a view of the relatively knife-edge-like end of the backdrop. I figured a bullnose would make the end of the backdrop (and the peninsula) more aesthetically pleasing [1]. Follow along to see how we built it.

2. After the November 2014 op session the end of the peninsula looked like this. Before the next session, the temporary Salem staging area will be dismantled, the upper deck peninsula benchwork and subroadbed installed, the backdrop (left) extended close to the peninsula end, and the final two miles of mainline installed. The full-length backdrop will block the view of crews in this aisle so they can't see the next towns to the east and west – increasing their feeling of isolation and making them put a little more skin in the TT&TO game we play during op sessions. Running on smoke signals would no longer be feasible.

3. By late November, 2014 the peninsula benchwork was completed and it was time to get cracking on the backdrop. The two plywood laminations will separate about 24" from the end of the benchwork, and will be screwed to the bullnose mounting plate. This photo shows the first layer of plywood in place. Note the warpage of the plywood visible at the seam. Once the two layers are laminated, the bowing disappeared.

4. Here's an inside view of the bullnose's mounting plate. It's made of three pieces of plywood and is attached to the benchwork and the backdrop support cleat in the ceiling. I used my trusty copy of 3rd PlanIt layout-design software to figure distances and angles (5). The backdrop plywood separates about 24" from the end of the backdrop and each piece is screwed to the mounting plate, holding it firmly in place.

5. A cross-sectional top view of the end of the backdrop shows how the backdrop layers (A) and (E) split and are screwed to the bullnose mounting plate cleats (B) and (D).

I created this diagram full-size in 3rd PlanIt. When done, I took distance and angular measurements directly from the CAD plan. It showed an angle between the backdrop pieces of 14.8°. Pieces B, C, and D needed to be beveled 7.4°. I was a little concerned that a 24" span of non-laminated backdrop might be prone to warping, but between being screwed to the mounting plate and stiffened by the curve where A and E separate, my concern proved groundless – no warps are visible.

USES FOR CAD

I've found lots of uses for CAD in the train room besides creating trackplans and figuring out how to support a backdrop bullnose. I've laid out a 200"-radius curve when there wasn't

room for a 200" trammel, designed control panel diagrams, created benchwork lumber cut lists, made plans for scratchbuilding bridges and structures, and even created custom fast clock faces. ■
.....

6. My friend Paul works for a shop where large cardboard shipping tubes arrive full of stuff, are unloaded, and discarded. He picked a couple of likely suspects and brought them to a work night. We used the larger one. I carefully measured its diameter and used that in 3rd PlanIt to design the bullnose mounting plate.

We were a bit concerned about dimensional stability after the tube was cut to fit on the end of the backdrop – PVC pipe definitely is not dimensionally stable when cut. However, it appears cardboard shipping tubes have little internal stress, and this one refrained from warping, twisting, or expanding after we cut out the necessary 194.8° needed for the bullnose.

[Click here to subscribe!](#)

7. My CAD program and a bit of high school geometry showed that we needed to slice a 198.4° segment from the shipping tube. The question was, how? Ripping it on the table saw would most likely result in non-straight edges where it would attach to the bullnose mount. Something that would provide steady support was needed.

I came up with the idea of screwing cleats to the side of the tube, then sliding the cleat along the top of my table saw's fence. This required adjusting the fence so that with the tube against it, the blade would be cutting perpendicular to the tube. Two cleats would be needed. Placing them would require a bit of finagling to allow for the saw blade's kerf (width of the cut).

But could we measure out the angles needed? Because the tube was hollow (duh!), there was no way to precisely locate the center of radius and use that as the base for a protractor.

8. Once again I turned to 3rd PlanIt. I drew a pair of concentric circles the same diameter as the inside and the outside of the tube. Then I drew two lines from the circles' center, spaced the needed angle apart. I printed it full size and we stood the tube on end on

top of the template and marked where the two radial lines protruded on the tube. With the tube set on the table saw so it was against the fence, we used a straightedge to mark the angles on the other end of the tube and drew a line between the two sets of marks.

We used couple of 1/4" x 3/4" x 48" strips of wood for the cleats, attaching them to the tube using #4 flat-head wood screws. Then with great trepidation we cut the tube, resting the cleats on top of the table saw's fence to keep the cuts straight. It worked!

The final step was cutting the bullnose tube section to the correct length.

9. To tell the truth, I wasn't convinced we'd end up with a usable bullnose. You can see here that it did work – we placed one of the cut off ends of the bullnose against the mounting plate and it was less than 1/32" wider than the mounting plate on both sides. I can tell you this was a big relief!

The tube we used had a drawback – there were pronounced spiral grooves in it that would be clearly visible once it was installed and painted. I didn't want the bullnose to resemble a barber's pole, so I sprayed it with six layers of Kilz primer, sanding with a 60-grit sanding block after each layer. The spiral grooves were still visible, so I brushed on three layers of my sky blue latex house paint, using the sanding block after the first two layers. Success at last! The grooves disappeared.

10. Now we needed to figure out how to attach the bullnose to its mounting plate. After much discussion we added two small cleats (F) on each side of the mounting plate's face, indenting them from the backdrop's surface a tad more than the bullnose tube's (G) wall thickness. We ran a large bead of construction adhesive up the edge of the cleats (F), spread the bullnose edges apart and pressed it in place.

[Click here for reader comments](#)

11. Remember that the bullnose was slightly wider than the backdrop? After scraping off the excess adhesive that oozed out of the seams, we covered the joints with blue painter's tape and temporarily screwed two pieces of 3/4" x 3" plywood

to keep the bullnose's surface lined up with the surface of the adjoining backdrop until the glue set. Once it was completely dry, we unscrewed the cleats, pulled off the painter's tape, and sanded down a few high spots. The seams weren't perfect, so we hit them (and the holes left by the screws that held the alignment cleats in place) with spackle. It took two layers of spackle before everything smoothed out. Two coats of sky-blue paint later, the seams (and holes) disappeared.

I still need to add clouds and hills and trees to the backdrop, but even in plain blue, it looks decent. The bullnose looks great, too.

12. This shot taken during my April 2015 op session shows the view seen peeking over the swing bridge at the entrance to the Bear Creek & South Jackson train room. The backdrop pinches down from the almost 7" diameter bull-nose to 3/8" thick, saving space for train stuff.

People entering the train room can no longer see the entire aisle between Redland and Junction City. Crews report that the combination of the backdrop and the additional two miles of mainline on the peninsula make the layout feel a LOT bigger than before. They also like the

feeling of isolation from not being able to see everything at once, and it is definitely quieter during an op session than before. I think the bullnose looks much better than the end of a 3/8" thick backdrop!

DCC THROTTLES ...

E-MAIL FREQUENTLY PROVIDES ME WITH ideas for this column. Recently there was a question about throttles (also called cabs or handhelds) on one of the groups I monitor. This got me to thinking about them and I decided to share some of those thoughts with my readers.

The throttle is one of the most important considerations in DCC. It is the equivalent of the keyboard, mouse, and display of your computer, all rolled in one. Here's where you tell the DCC system what you want it to do, and it tells you what it is doing.

Frequently, a user's comfort level with the throttle drives their selection of DCC system brand. As I recommended last month (mrhpub.com/2015-08-aug/port), try all the various throttles for the brands of DCC system you are considering. What comes with a beginner's set may not be what you will want to standardize on for your eventual layout.

Very few throttles will work with more than one brand of DCC system. The ones that do work with different systems are

► **DCC TIPS, TRICKS, AND TECHNIQUES**

usually third-party units and are frequently not as ergonomic as the name brand units. This is why it is important to be comfortable and happy with the throttles offered by your manufacturer. The makers will tend to keep the same models for many years with perhaps a feature adjustment along the way.

Let me say that there is no throttle that I personally find perfect. For operations, I own a Digitrax UT4R (radio) throttle and a NCE Cab-06PR (potentiometer, radio), as I frequently operate on layouts with both systems. My ideal throttle would combine features from both of them.

It is important that you like the throttle for your system and feel comfortable with it. Here are some features and ideas for your consideration.

Types of throttles

One of the important criteria is the way that you tell the system how fast you want the loco to go. Speed is by far the most frequently changed setting. Throttles tend to be grouped by the method of speed control. There are four basic ways of communicating speed desires to the system. I've been hoping someone would develop direct telepathy, but so far, no luck.

Potentiometer is a fancy name for the type of control that was used to adjust volume on radios a few years ago. They rotate about 270° and have stops at the ends. Throttles that use pots (short for potentiometer) usually have a line on the knob so you know where you are in the rotation.

1. Digitrax UT4D (duplex radio) potentiometer style throttle – direction selector switch is on the top left, here in the center-off (brake) position.

DCC IMPULSES | 4

The advantages of a pot style throttle are:

- Quick, visual confirmation of your speed setting. Just look where the line is pointing.
- When using a throttle in “yard mode” (which I’ll discuss later), having a line showing you where the pot is positioned is helpful.

The disadvantages of pot style throttles are:

- The stops on the pots used in modern throttles are not as robust as those in classic radios. Heavy-handed operators can break them. You might ask about repair policies and costs for the brand(s) you are considering.
- When you select a loco with a pot throttle, the train immediately goes to the speed and direction set on the throttle. When you are running more than one train on a single pot throttle, the transition between trains can be interesting: instantaneous speed and/or direction changes

Encoders are increasingly used in volume controls and they have advantages in throttles, too. They go around and around with no stops, thus, there is no need for a line on the knob. It would be meaningless.

2. NCE Cab-06er (radio) encoder style throttle.

DCC IMPULSES | 5

The advantages of an encoder equipped throttle are:

- No stops to break.
- When moving between multiple trains, there are no speed or direction surprises.

The disadvantages of an encoder equipped throttle are:

- No direct indication of speed setting, unlike the line on the knob of a pot throttle.
- No indication when you have hit the end of the control area. With a pot, there are specific stops - you know when you hit zero or max speed. With an encoder, you wind up turning the knob counter-clockwise just to make sure you have set the speed all the way to zero.

Button control as the exclusive method of speed control is rare on throttles. Some high-end throttles have both knob control and button control. The two most popular throttles exclusively with button control are the Lenz LH100 [3] and the NCE Cab-05. I personally don't like button control for most running. On the rare occasion when I'm trying to hit a specific speed step, like the first step, I find buttons advantageous.

All of the exclusively button control throttles that I'm aware of use two

3. Lenz LH100 button control throttle – the down speed controls are circled, the up speed controls are the buttons on the right.

buttons for each direction. One button (labeled V on the LH100 [3]) moves one step and the other moves several steps, for each direction.

Slider speed controls, while seen on some DC power packs, are rare on DCC throttles. Sliders are represented on WiFi connected smart phones and tablets. There are apps for both Android and Apple phones. The basic apps are free. The full-featured version costs a few dollars. The DCC system needs to be running JMRI and be connected to a computer and a WiFi hot spot.

The slider control in these apps is frequently a yard mode style, where the middle of the range is zero speed (as shown in [4]) and each end is maximum, either forward or reverse.

Ergonomics, including knob orientation

How does the throttle feel in your hand? Can you adjust speed with the hand that is holding the throttle or do you need two hands? How easily can you read the display and from what angles? How easily can you access the function buttons? These are the ergonomic style questions for you to evaluate.

Bucking the trend of having the control knob stick straight out of the front of the throttle, the NCE ProCab [5], and the related PowerCab, both have the encoder mounted with its shaft parallel to the front panel with the edge of the knob sticking out.

Some folks feel that this is one of the most ergonomic designs available, yet others are turned off by the unorthodox design. Personally, I like it

Programming throttles vs. operator throttles

Most DCC systems have two levels of throttles, those that are aimed at operators and those with a lot more buttons and functions to program locos and set up consists. There is frequently a large dollar price difference between them, too.

Most layout owners have a limited number (perhaps one) of programming throttles, and more operator throttles. Several reasons are behind

4. Slider style throttle on an iPhone using the free WiThrottleLite app.

DCC IMPULSES | 8

this, including minimization of cost and keeping programming capabilities out of the hands of the entire fleet of operators. Frequently there will be a hostler job where consists need to be created or broken up. This job will need the programming throttle. Once the consists are built, they can be run on any throttle.

The NCE PowerPro system allows the user to tell the system what cabs can program locos and set consists as a way to minimize these problems.

Displays, consists and programming

A few of the operator level throttles display what the command station is doing, such as a confirmation of the loco direction. The NCE Cab-06 series [2] is an example of this style.

By necessity, programming throttles, such as [5] and [6], need to tell you what the command station is doing, so they

5. NCE's ProCab with the (encoder) speed control knob extending edgewise out of the front panel and speed control buttons, too, all in the SPEED box. Many folks comment on the very readable display.

have a display. Since they have a lot of controls and a display, they tend to be a bit cumbersome to hold. I have developed techniques to operate with either the DT400 series or the ProCab, but each took some getting used to.

In selecting a throttle, check out the display visibility when directly viewed and when viewed off angle. Take the time to understand what it is telling you and see how logical it seems.

Selecting direction and yard mode

There are two basic ways of selecting the direction of travel for your train:

- A toggle switch, such as on the Digitrax UT4 series [1]
- Push buttons, such as on the NCE Cab-06 series [2]

The advantage of the Digitrax method [1] is that there is a center-off position. You can “center your selector,” as they say in prototype diesel locomotives, and know that the loco won’t be told to move by a bump on the knob. The disadvantage of this sort of design is that it may be more difficult to operate one-handed.

6. Digitrax DT400 series throttle with two encoder speed controls (black knobs) and a small display screen – the duplex radio DT402D model is shown.

The advantage of the NCE method [2] is that there is a button which will toggle the direction that can easily be pressed with the hand that holds the throttle. Some models have buttons for forward and reverse, so that you can make sure the loco will move in a desired direction. The NCE throttles also have an option for yard mode.

Yard mode is a fun way to switch cars. With a potentiometer throttle, the stopped position is with the pointer at 12 o’clock. When the pointer is at 7 o’clock, the loco is being told to run full speed in one direction. 5 o’clock is full speed in the other direction. I like switching this way. However, there is a learning curve. When things go a bit awry, the natural tendency is to rotate the knob fully counter-clockwise. This would be zero speed with a normal throttle set up. With yard mode, fully counter-clockwise is full speed in one direction.

Cutting the cord – wireless operation

Getting away from tethered operation usually enhances the operating experience. It is nice to not have to worry if you are plugged in to change speed or stop quickly. Another benefit is avoiding a tangle of cords.

Most DCC systems are available in wired and radio versions. If you don’t start with a radio system, I recommend you investigate how to upgrade to radio should you decide to do so later. Digitrax and NCE both offer after-the-fact factory radio upgrades for their throttles. Both also offer the radio base units by themselves. So, converting to radio can be as simple as purchasing a radio throttle and a radio base unit and plugging the radio base into your throttle bus. And you may be able to have your existing throttles upgraded.

DCC IMPULSES | 11

The use of WiFi-connected smart phones [4] with a JMRI computer controlled layout is another way to easily add cordless throttles. Smart phones are frequently available for bargain prices, making for a very inexpensive way to have a bunch of wireless throttles.

SOUNDTRAXX ECONAMI DECODER ...

Just as I started this column in mid-July, SoundTraxx announced a totally new sound decoder line. The Econami series (soundtraxx.com/dsd/econami/index.php) is the beginning of a new series of decoders to replace the aging Tsunami series.

The Econamis will be available in 1-amp and 4-amp versions, with \$80 and \$150 list prices. The 1-amp version will be available with two interfaces – wires and the 21-pin board that has become so popular amongst loco manufacturers.

They should be shipping by the time you see this in print. I plan to have a full review in a column very soon. ■

7. ECO-100 1-amp Econami decoder – 27 x 10.5 x 5 mm – \$79.95 MSRP.

8. ECO-400 4-amp Econami decoder – 69 x 30.5 x 14 mm – includes a 3 watt audio amplifier – \$149.95 MSRP

TONY THOMPSON
.....

**Click here for
reader comments**

TWO GOOD WAYS TO CONVEY YOUR MODELING ERA

IN ONE OF THE FIRST COLUMNS IN THE *MRH* "GETTING Real" series, back in November 2011 (mrhmag.com/magazine/back-issues), Jack Burgess discussed the process of choosing a date to model, and ways to reinforce that choice, in terms of the things you place on the layout. Among an extensive discussion, he mentioned that automobiles are among the most familiar objects that anyone can date, whether they are modelers or casual visitors to a layout, and therefore that automobiles must be model-year consistent for your chosen era. Obviously they cannot be cars of a model year later than your modeled year, but can represent a fair range of previous years. Jack emphasized that cars should also have license plates, and mentioned billboards as period setters.

I want to expand on these points, because I believe there is more to be said. I also want to explain a little about how I

► **MODELING REAL RAILROADS AND WHAT THEY DO**

GETTING REAL | 2

have done some of these things, just to show that multiple approaches are possible. This includes modeling procedures. I'll begin with billboards.

Billboards

Period advertising can be as revealing of an era as anything you can place on the layout. Some modelers have papered the sides of their buildings with posters which may fit with some eras, but were not often seen in the time I model, the 1950s. But roadside billboards, on the other hand, have been with us a long time, and have the advantage of providing bigger images.

The first challenge may be the billboard structure itself. For some years, Walthers offered a nice set of three roadside type billboards, their number 933-3103 and related numbers for

GETTING REAL | 3

various periods, but these kits have apparently been replaced by the number 949-4250 sign kit. Other kits for billboards have been available over the years, but I won't review them, because these structures are not at all hard to scratchbuild. I show a scratchbuilt example in [1] and [2].

The board itself is styrene sheet, with vertical posts and rearward-angled diagonal supports. Each post also carries a horizontal member, tying the post to the diagonal and extending forward to support a walkway for sign posters to use. Lastly, a horizontal tie also extends across the back of all four diagonals.

As for dimensions, I have used both scale 4 x 4-inch and 6 x 6-inch posts, and 2 x 6-inch diagonal supports. If the posts run to the top of the board, as you see in [1], the diagonals can tie into them at the top. An advantage of making a billboard

- [TABLE OF CONTENTS](#)
- [INDEX](#)

GETTING REAL | 4

structure this way is that you can suit its dimensions to an item of advertising you want to use.

Once you have a structure, whether scratchbuilt or from a kit, the second challenge can be the signs to place on your billboards. Almost any Google search on this and related topics will return a lot of images, some of which can be downloaded and adjusted in size for HO scale billboards (more on that in a moment). Commercial billboard reproductions also abound, especially from JL Innovative shop.jlinnovative.com/HOScale-Signs-Billboards_c25.htm and others, such as City Classics cityclassics.biz/window_signs.html; scroll down to billboards. But you can readily find your own. I show later in this column some of the images I was able to find on the Internet and adjust for my use.

In choosing advertising, it may not always be obvious from which era or year the image comes. Here again, Google

2. The same billboard shown in [1], but from directly above. Here you can see the walkway below the signboard, as well as the rear support structure.

GETTING REAL | 5

searching in company histories or product histories can often reveal answers. A second point to consider is the choice of regional brands. National brands such as Coca-Cola, Shell Oil, Ford Motor Co., or Nabisco certainly have their place, but regional brands help set your location in a particular part of the country. As my layout is set in California in 1953, I want to use plenty of regional images among my billboards.

My modeling time was in the period of largely unrestricted billboard use. After the passage of the federal Highway Beautification Act of 1965, not only were billboards strongly restricted along Interstate highways, but state and local authorities went on to add further restrictions on size and numbers of

3. An example from outdoor advertising giant, Foster & Kleiser, of one of their first 12 x 25-foot billboards in 1925. The lattice beneath the sign was common in cities.

GETTING REAL | 6

billboards. Older billboard structures (except along Interstates) were often grandfathered, however, and there are areas where quite old billboard structures remain today. The result is a wide mixture of sizes in use.

This raises the topic of the size and proportion of the billboard images you wish to use. Commercial sources, as well as images you can find on the Internet, probably will not be the correct size or proportion for any particular model sign structure. It may be worth mentioning that the Walthers signboard does not appear to be a common prototype proportion. It has a space, in HO scale, which accepts an image of 10 x 22 feet. The first standardized billboards, early in the 20th century, were 10 x 25 feet (known in the advertising business as a “24-sheet poster,” for the number of printed paper panels comprising the entire image). Another common size in the 1950s was 12 x 25-foot size; an early example is shown in [3].

Most prototype boards had a higher proportion of height to width, compared to the Walthers board, such as the prototype 10 x 30-foot boards (a “30-sheet poster”) which became popular in the mid-1950s. But a variety of sizes was erected for custom signs, so some variation is all right. Certainly the Walthers version looks acceptable as layout scenery.

As I mentioned above, with a scratchbuilt billboard, you can suit it to the image you want to attach. Another approach is to standardize on the Walthers 10 x 22-foot size. Advertisements of other proportions, if not *greatly* different, can be distorted to the 10 x 22 proportion using Adobe Photoshop or comparable software.

Simply uncheck the box for “Constrain Proportions” in the “Image Size” dialog box, then make the image the size you want.

Heckman's Canadian Pacific

A Photographic Journey

by Ralph Beaumont

Joseph Heckman was a pioneer photographer for the Canadian Pacific Railway. He photographed the line from coast to coast between 1898 and 1915, capturing the engineering works, stations, hotels, steamships, and the people who made the railway run. More than 4,000 of these historic images are preserved in the CPR's Corporate Archives, and 380 of them have been made available for this large format, hard cover book.

GETTING REAL | 8

In HO scale, this is 1.38 x 3.03 inches, and for some purposes, this degree of precision really is required, as noted below.

Note in [3] that there is considerable white space around the advertisement itself. This was common in the 1950s and earlier, and offers another strategy in modifying the proportions of an image: simply add or subtract white space to make it fit.

The Walthers kits each supply six or more billboard images. Many are for Eastern companies, and some are from later eras than the 1950s. Accordingly, you may need to look elsewhere for appropriate regional and era-correct images. I searched on the Internet for some time, finding all kinds of varied billboard and other advertising images, and I found online resources which could in many cases provide the year or years when the image was used. Though many of the online images are copyrighted,

4. This is a Walthers billboard (kits have three). The sprue on the left contains the signboard, walkway, back brace, and floodlights (optional: many billboards had no lights). The sprue on the right contains all four support members.

GETTING REAL | 9

you are permitted to download and print them for your own personal use.

Interchangeable billboard images

A key idea with billboards, should you wish to do so, is to provide for interchangeable advertisements. I had this idea simply because I found so many billboard images I wanted to have on the layout, that I realized I needed a way to display more than one per billboard. You might, for example, have different billboard images every time you operate, if you like. After all, they were periodically changed on the prototype, too.

It turns out this is really easy to do. I will illustrate it on a Walthers kit signboard. First, [4] shows the Walthers sprues for each billboard. I simply add a strip of scale 1 x 6-inch styrene

5. The Walthers signboard, still on its sprue, with scale 1 x 6 styrene strips attached. You can see on the left edge how the added strip is positioned just at the top of the slanting edge of the sign area.

6. The Walthers billboard assembled, with the added white styrene side strips obvious.

along each side. I show in [5] the addition of these side strips to a Walthers signboard. On a scratchbuilt billboard, I have put scale 4 x 4 styrene strips around the bottom and sides of the image space, then added the 1 x 6 to project inward, just as on the Walthers board.

To show an assembled billboard, [6] illustrates the Walthers board (with reduced-height supports, as kit directions advise), and with the side strips not yet painted. The billboard can also be built to its full height, if needed to suit your layout location.

Then, if the advertisements are accurately 10 x 22 HO feet, they can slip right into the board, and are readily removed so others can be substituted. (This is the reason you may need to achieve exactly the correct size images, as mentioned above). The substitution process is very simple. [7] shows the use of tweezers,

but with a little practice, the ads can readily be inserted or removed with your fingers.

Finishing a billboard can be simple. These signboards were often dark green; I have also seen white and dark gray ones. If you are so inclined, you could also add the name of a sign company along the top or bottom of the signboard. Most billboards in an area were built and managed by a sign company, which in turn contracted with ad agencies for use of the billboard space. These companies often identified themselves on the billboard structure.

7. In this photo, I am demonstrating the insertion of an advertisement into the Walthers signboard, still on its sprue, see [5], with added side strips. The tweezers shown being used are not essential for this job. The period Signal Oil and Gas Company ad shows a familiar Signal slogan of the 1950s; Signal was a California oil company until its merger in 1964 with aerospace parts manufacturer Garrett Corporation.

Throughout the West, many roadside signs were managed by Foster & Kleiser, and I have put that name on some of my billboards. [3] shows the Foster & Kleiser name at top, see [8]. Another familiar billboard owner and operator was Pacific Outdoor Advertising, especially in southern and central California, and I have used that name also. Both are shown in [9].

A few examples of usage may be of interest. In [10], I show a strong era-setting image, an ad for a new automobile model,

8. A typical example of a Foster & Kleiser nameboard.

Want to keep MRH free?
CLICK on ads.

If ads in MRH don't get clicks, then advertisers won't advertise with us, it's that simple ...

9. These two billboards carry names of outdoor advertising companies, Foster & Kleiser on the upper board and Pacific Outdoor at the lower one. Public service ads, like this one for the Navy, were often seen in the 1950s.

10. This billboard carries an advertisement for the new 1953 Chevrolet. Few things can set your era more clearly than a specific date on a billboard. Below the sign, patrons of the Dolphin & Anchor Tavern are enjoying the fresh air.

and in [11] a Western beer company ad. Both these billboards are built to exchange ads. To show that more clearly, [12 and 13] show the same billboard structure with two different ads in it. To repeat what I said earlier, ads on prototype billboards changed periodically, so yours probably should, too.

Among the advertisers I have chosen to feature are Western beer brands (Lucky Lager and Acme), Western oil companies (Signal, Associated, Union, Richfield, and Chevron), and iconic Western clothing (Levi's jeans). One great era-setter is either a poster from a specific political campaign year, or for the introduction of a new model automobile; [10] shows the 1953 Chevrolet. Finally, ads from companies like Coca-Cola were ubiquitous, and I included a couple of them, too.

 [Click here for reader comments](#)

11 [previous page, top]. This particular Walthers billboard structure has been assembled full-height, something that may be suitable for some locations on a layout. The slogan used by Lucky Lager (previous page) may be a teeny exaggeration. Lucky Lager Brewing was headquartered in San Francisco, and in the 1950s became the best-selling Western beer.

12 [previous page, bottom]. Emphasizing another regional characteristic is this advertisement for Levi's clothing (previous page), with a slogan they used extensively in the 1950s, "as Western as the West itself." Levi Strauss & Company, of course, is still in business and still headquartered in San Francisco.

13 [above]. The same billboard structure here hosts an ad for Associated Oil Company, and their Flying A marketing brand. By the 1950s, Associated was the Western part of Tidewater Associated Oil Company, but continued consumer marketing under its own name.

A word on copyright and trademark. Some of these advertisers controlled, or attempted to control, use of their trademarks and images, even ones dating back 50 years or more. But using an image from a book or the Internet, copied only for your personal use, does not violate copyright. Publishing such images for general use would be another matter, which is why I am not supplying scale-size billboards for your use.

License plates

Even though license plates on HO scale vehicles are quite small, we are all familiar with their appearance and location, so that omitting them is more evident than you might think. They are not hard to create and apply, and gradually I have attached them to all motor vehicles on my layout.

Right from the beginning of the automobile age, each state issued motor vehicle plates, which for many years were quite distinctive, differing not only in color, but in size and proportion. The history of these plates is of interest not only to model railroaders, of course, but to everyone from local historians, to car restoration people, to nostalgia buffs of all kinds. So we modelers benefit from the work of many.

There are excellent resources on the Internet about vehicle license plates for all states and all eras. It is worth spending some time to find information on your modeled state and era. My own modeling is set in California, and there is a useful and quite complete Wikipedia entry about history and use of California plates, including my modeled year of 1953 see: en.wikipedia.org/wiki/Vehicle_registration_plates_of_California. Many state Departments of Motor Vehicles also have online license plate histories.

In addition, there is a website offering reproduction plates for many states (and countries) and many years, available at: licenseplates.tv/index, and this site not only has a lot of history for a wide range of states and eras, but also has good images of license plates to view. The site used to include California plates among all the others, but for some reason it does not do so now. If that's what you want, you might check back from time to time to see if they are restored to the site.

It is worth mentioning that many “antique” or second-hand stores will offer a few old license plates for sale. I had been casually looking for these, and found a 1951 California plate, shown in [14]. As the history recounted below explains, this turned out to be an excellent find. But in any case, it can be fun to keep your eyes open for suitable plates of your modeling era.

But for whatever state you model, or whatever year, you can have accurate automobile and truck license plates—if you wish. Obviously if you model “the 1950s,” there is no license plate that

14. Actual 1951 California plate, a little the worse for wear but clearly showing letters and characters.

fits the whole decade, and you might just as well use little dark rectangles with no lettering, or even omit license plates altogether. But if you want to have actual plates, it may be helpful for me to describe how I made mine. First, the history.

The basic facts are that until 1942, California issued complete new plates every year. Then from 1945 into the late 1950s, new plates only came out every several years, and metal corner tags were issued for each intermediate year. This corner tag covered up the year stamped in the original plate, and contained the current year. For automobiles sold in intermediate years, small numbers of new plates, stamped with the current year, were produced.

Turning to my own modeling year of 1953, as it happens, California had issued a new plate in 1951, which was black with yellow numbers. (This, of course, is the exact plate I found, shown in [14].) In 1953, a lower-right corner tag of stamped metal was issued, white in color, with the number “53” on it, covering up the “51” part of the year on the original stamped plate.

15. In 1953, owners of plates from previous years 1951 or 1952 were issued a white corner tag, which was attached at the right-hand bolt hole in the original plate.

Thus by 1953, most plates were 1951-issue, with small numbers of 1952 and 1953 new plates, and all 1951 and 1952 plates carried white corner tags for 1953. But because of the new plates issued in 1953 which did have the 1953 date stamped in, I need a mixture of some new 1953 plates, and a lot of corner-tag plates, since all cars older than 1953 would have the 1951 plates with corner tags.

To illustrate, [15] shows an image of a California plate with a 1953 corner tag. This could be a 1952 or, more likely, a 1951 plate, with the 1953 tag.

The format of numbers and letters shown in [15] is typical. In that era, there was also a format for what were termed “commercial” vehicles, such as delivery vans owned by businesses (today that distinction has disappeared). These also had yearly corner tags (for the same reason as automobile plates), as [16] shows.

Finally, vehicles classified as trucks, whether or not used commercially, such as pickup trucks or business-owned highway trucks, received still another different plate in California in those

16. Vehicles classified as “commercial” used plates with this format in the early 1950s.

years (and still do). [17] shows an example for 1953. Today, all commercial vehicles in California receive a plate descended from that shown in [17].

For modeling purposes, I need to use all of these formats, as appropriate for individual models. I wanted also to have a few out-of-state plates among all the California ones, though in 1953 I would guess these would have been uncommon where I model, along California’s Central Coast, fairly far from the main tourist areas. Examples might include [18], a Colorado plate for 1953, with a nicely contrasting shape and color, compared to the California plates, or Arizona, shown in [19].

Finally, small numbers of new cars, or cars which had new licenses in 1953 had to be issued 1953-stamped plates. An example is shown in [20].

You can readily find on the Internet the dimensions of license plates for any year in any state. In 1951, the California plate was 6 by 14 inches, which I can verify from my original 1951

17. Most trucks were issued plates like this, with a single letter of the alphabet leading all digits. This is still California practice, though today a number precedes the single letter.

plate. In HO scale, this is one-eighty-seventh as big, or about 0.07 by 0.16 inches.

Once you acquire digital images of plates, then, simply reduce them to these dimensions (other states and other years had

18. The Colorado 1953 license plate, one example of an out-of-state plate that might have been seen in California at the time.

19. Another obvious out-of-state plate for Central California might be Arizona, unfortunately a black and white plate in 1953 and thus not very distinctive in HO scale.

20. New cars, or cars newly licensed in 1953, received plates without corner tags. They looked like this. I have applied a few such plates on my layout.

different proportions of width to length). I recommend setting the resolution to 2000 dpi if you can do so, since otherwise they will not be readable. I collected a range of desired plate images, placed a whole bunch of them on a single layout page, and had them printed on glossy paper at my local copy shop, which has a high-resolution digital color printer. Once printed, they can be quickly cut out and glued onto your model trucks and automobiles. For this kind of job, I like to use canopy glue.

License plates on model vehicles

A few photographs of some of my HO vehicles with their license plates will show what I am trying to accomplish. A group of parked cars as in [21] “looks right,” with every one carrying a California license plate. [22] shows that they are indeed readable. And for the truck license plates, I show [23], following the format of [16]. [24] shows one of the “com” plates on a delivery truck.

I know there are those who regard the whole topic of HO-scale vehicle license plates as rather excessive refinement, but I

21. A group of cars is parked at right, all with correct California plates for 1953, while the drivers get a cold drink or a burger at the Giant Orange stand. At left, the tourists pulling a trailer have an out-of state plate, showing that they have come all the way from Pennsylvania. Their plate is, of course, correct for 1953.

have found it fun to research, learn about, and create accurate automobile and truck license plates for my modeled era and locale. The specifics of my 1953 California plates are presented only to illustrate what can be done if you wish. Locating the desired information is itself engrossing, and license plates are yet another topic where “Google can be your friend” in the search.

22. A closer view of one of the automobiles shown in [21] shows that the plate is indeed readable. Since the model represents a 1953 Chevrolet, its plate is naturally a new 1953 plate with no corner tag. Luckily we don't usually see model vehicles at this size, revealing the limitations of its resin casting.

THE WOODWARD IRON RAILROAD

| A SPECIALIZED RAILROAD YOU CAN MODEL ...

LIFE AND DEATH OF THE PROTOTYPE

MODERN SHORTLINES BEAR NO RESEMBLANCE TO their predecessors of the last century and before. Beginning in the 1980s with the deregulation of the railroads, leading to the four mega-railroads we have today and their ability to abandon or spinoff the less profitable branches, we have had the rise of shortline holding companies. Some well-known names, Genesee and Wyoming, and less familiar names, Watco Industries, now own and control over 60 shortline railroads. This results in a homogenization in paint schemes and identities of the individual shortlines. This isn't necessarily a bad thing, as it has saved many communities from the loss of vital rail services. What we have lost is the oft-times quirkiness of the local shortline.

Up until the late 1960s there were hundreds of shortlines in

▶ RAMBLINGS ON THE NARROW GAUGE

LITE AND NARROW | 2

the United States. Some of these were very long and served many different industries along their route. Others served one or two industries, while still others were captive to an industry. The former shortlines are still in business, owned now by holding companies, and the latter two have pretty much disappeared as demand for the product vanished. Such was the case with the Woodward Iron Railroad that survived until the late 1960s. Today there is very little remaining of a once very busy shortline.

History

To understand how the Woodward Iron Company (WICo) came into existence, you have to look at the geography and the geology of the Birmingham District. Located at the tail end

1. Aerial view of the Woodward Furnaces celebrating 75 years of service by the Southern Railway. From an article published in January, 1959 *Ties The Southern Railway Magazine*, and posted on southern.railfan.net.

LITE AND NARROW | 3

2. The engine on the right is one of the H. K. Porter 0-4-2Ts, either the #2 (Built June, 1882, construction # 498) or the #6. *John Stewart Collection*

of the Appalachian Mountains, the Birmingham District was blessed with being one of the few places in the world where the three necessary ingredients for making iron, and later steel, were in close proximity to each other. To give an idea of how close they were, it was said that when the Woodward furnaces were in operation, you could go to the top and see the mining operations for both the iron and coal. While not needed by Woodward, the furnaces were self-fluxing; the property with the limestone deposits was also visible. Because of this closeness and ease of obtaining the natural resources, the Birmingham District has had some kind of iron production dating back prior to the Civil War. Ironically, some of these early furnaces have been restored and are in state parks, while facilities that were built much later have vanished from the landscape.

LITE AND NARROW | 4

The story of the Woodward Iron Company actually begins in Wheeling, West Virginia, where, in 1849, the Belmont cut nail mill was established by E.M. Norton, under the company name

3. No.14 and friends at No. 3 stockhouse c. 1910. The engine with the slope-back tender facing the photographer is the #9 (built by Baldwin, December, 1898, construction #16389), the only one of WICo's 0-6-0s that was actually built for use at the Woodward furnaces, and spent its entire life there. The #9 was sold to Birmingham Rail & Locomotive for scrap in December, 1938. At far right in the shop panorama is the #10 (Built by Baldwin, May, 1900, construction #17773), Woodward's only 2-6-0. They eventually sold the #10 to the Woodstock Slag Corp. for their operation located just behind the WICo furnaces. It lasted until 1946. The #10 was the original "heavy" stockhouse-trestle engine for Woodward. *John Stewart Collection*

LITE AND NARROW | 5

of Norton, Bailey and Company. Among the employees at the Belmont mill was S.H. Woodward. Woodward was a nailer at the Belmont mill, and probably came to the mill from either the Virginia mill or the Top mill, both being established in 1840. A nailer was a highly skilled individual, who along with a puddler, was the highest paid in the cut nail mills and thus could afford to invest in them. A nailer's job consisted of maintaining and repairing the nail machines, grinding and sharpening the nail-cutting knives, and making the dies associated with the nail machines. A puddler was a highly skilled individual who manipulated molten pig iron in a puddling, or reverberating, furnace to remove surplus carbon from the pig iron. The process involved the puddler to use long bars to manually stir, or puddle, the wrought iron until it eventually made a single lump in the center of the furnace hearth. The lump was then removed and hammered on a forge to remove the slag. This was done repeatedly until the wrought iron was ready to be rolled into bars or sheets. As a side note, reverberating furnaces were also used in smelters.

In 1851, Norton and 22 others left the Belmont mill and formed Bailey, Woodward and Company and began construction on a new mill, which was to be named LaBelle Iron Works (pronounced LAY BELL) after the French name for the Ohio River: La Belle Riviere, the beautiful river. Woodward became a managing partner in the company. It was interesting to note that most of the founding company members came from the various nail mills around the Wheeling area.

From the beginning, LaBelle was a fully integrated operation, with rolling mills, furnaces, and nail machines, under one management, making one product: cut nails. In 1859, the

LITE AND NARROW | 6

company further integrated their operations by purchasing the Jefferson Iron Works in Steubenville, Ohio, across the river from Wheeling. This purchase increased their number of nail machines and included two tracts of land containing woodlot and coal holding. Due to the wartime scarcity, and the wildly fluctuating of the price of pig iron, the company constructed two blast furnaces at the Steubenville site, one in 1862-63 and one in 1864. To complete the integration, the company sank a deep-shaft mine on their property to tap their coal reserves, thus insuring their control over their raw materials. Other Wheeling companies followed suit.

In January 1869, S.H. (Stimson Harvey) Woodward visited northern Alabama, investigating reports by Union veterans of rich coal and iron deposits. He had learned about the rich mineral

4. The Santa Fe with train is coming in from the coal mines.

resources in February 1867, when traveling by steamboat on the Ohio, from two soldiers who, during their campaign against the Confederacy, had noticed vast deposits of iron ore, coal, and limestone within a few miles of each other. Understanding the significance of this information, with regards to iron making, he made a mental note about it, but was unable to do anything about it until two years later.

What he found was a densely forested land that was sparsely settled and had been the hunting grounds for Chickasaws, Choctaws, Cherokees and Creeks less than a generation before. He also found a fledgling iron industry scattered about the

area, but nothing to rival the size and capacity of the Wheeling operations. After seeing the “red ore” deposits, geologists would estimate them to be over a billion tons in Jefferson county, and the brown ore in Shelby county convinced Woodward of the validity of the soldiers’ story. Within a month he purchased 550 acres of land on Red Mountain, spent \$30,000 on other coal and ore lands and, in addition, purchased a 2,000-acre tract near Woodstock in Tuscaloosa County. These properties were to become the nucleus of the Woodward Iron Company.

In 1836, Woodward married Margaret Glass, and eventually they had four sons and four daughters. In the 1870s, two of the sons, Joseph H. Woodward (J.H.) and William H. Woodward (W.H.), investigated the possibility of using the coking process

6. Woodward #5 an 0-4-2T. It looks like the trailing truck was an afterthought from the spacing under the engine.
John Stewart Collection

7. Train with locomotive #1 or #2 leaving red ore mine #1.
John Stewart Collection

(beehive coke ovens) at the Alabama lands. For many years the coal in the south was considered inferior and not usable for coke. Alice Furnace came on-line in 1880 using southern coke, and this attracted northern capital to the area. Agreeing that the coking process would be possible, the two sons founded the Woodward Iron Company following their father’s death in 1881. W. H. served as president, while J.H. served as secretary-treasurer. Construction was begun almost immediately on the site’s first blast furnace, 12 miles southeast of Birmingham, and was completed in 1883. The site was ideal. This close proximity of its operations, made possible by careful and early acquisitions, similar to the methods used earlier at La Belle, gave Woodward one

of the lowest raw material assembly costs in the nation. While the Woodward Iron Company did not fully integrate producing finished products, such as iron castings, until the twentieth century, it did have full control over that which the Woodward's chose to produce.

The Woodward's plans were thorough. They called for a blast furnace; 150 beehive ovens (coke ovens so named because they resembled giant beehives); ore and coal mines, and about eight miles of in-plant railroad to serve them.

The railroad

The railroad was built as early as 1883, when the first Woodward blast furnace was put into operation. This early railroad shows clearly on the 1887 map available on the University of Alabama's online map archive. This early railroad linked the company's

8. Narrow gauge operations at the #2 red ore mine.
John Stewart Collection

9. Hoist house and narrow gauge at the #2 red ore mine.
John Stewart Collection

coal mines at the north end to the blast furnaces near the mid-point, and then on to the red ore mines at the south end, a distance of eight miles. In an 1889 report of assets, the company had five locomotives and 83 coal and ore cars in operation. It was also reported that the railroad had connections with the AGS (Alabama Great Southern, today Norfolk Southern) two miles from the plant and the L&N (Louisville and Nashville) plus others less than ½ mile from the furnaces.

By 1907, Woodward had three furnaces in operation, and the AB&A (Atlanta, Birmingham, and Atlantic) arrived in Bessemer, AL.

LITE AND NARROW | 12

Through a prior agreement, the AB&A began the 13-mile construction to the Mulga mine, which would become part of the Woodward holdings in the near future. Over the years, the AB&A evolved into the Atlanta, Birmingham and Coast, and then the Atlantic Coast Line. It is now part of CSX. The trackage was abandoned and scrapped from downtown Birmingham to Parkwood Junction, south of the city, where the remaining portion of the line splits off of the old L&N line from Birmingham to Montgomery and goes to Manchester, GA. The only remnants of the abandoned portion of the line are some beautiful concrete overpasses in Bessemer, and a curved girder bridge over the Norfolk Southern mainline.

The AB&A extended a line to the Mulga Coal Mine owned and operated by Birmingham Coal and Iron. In 1912, Woodward

10. HH900 # 65 at the end of its life. rrPictureArchives.net, Robert Farkas contributor

LITE AND NARROW | 13

11. SW1200 #52 showing the simple paint scheme Woodward applied to their locomotives. rrPictureArchives.net, Robert Farkas contributor

purchased Birmingham Coal and Iron, and leased the AB&A's Mulga Branch. While the ICC valuation records indicate the acquisition was 14 miles, plus four miles of spurs, part of the trackage was parallel to the Woodward coal line to Dolomite making the net acquisition around five miles. Sometime between 1924 and 1930, Woodward assumed complete control of the Mulga branch, leasing the parallel trackage to the Birmingham Southern.

In addition to the Mulga Coal operations, Woodward acquired the Birmingham Coal & Iron company's facilities in North Birmingham including the two Vanderbilt blast furnaces. To supply the furnace, Woodward operated raw material trains

LITE AND NARROW | 14

between the coke ovens at Woodward and red ore mines to Vanderbilt using trackage rights with the AB&A. The distance from the Woodward furnaces and the Vanderbilt furnace was about 13 miles in a straight line, but the distance on AB&A was somewhat longer.

Other BC&I facilities were located several counties east of Birmingham, and included coal and brown ore at Tecumseh, AL. These materials moved by class-one railroads. The cost of operating with trackage rights, or of paying common carrier rates, was more than the cost of operating the company's private railroad. In the long run, these transportation costs caused Woodward to abandon the facilities not served directly by the company's own railroad.

There were three Woodward ore mines, Woodward #1, #2 and #3. Woodward #1 was located south of Paul's Hill in Bessemer. There was a tailings dump on the south side of the mountain, at the end of track. In addition to administrative offices, this site also included doctors' offices, an elementary school (Red Ore) and the commissary. Woodward #2 was south of Lipscomb, west of TCI #6½. Woodward #3 was also south of Lipscomb, and

12. 100-ton cars built for Woodward by Pressed Steel Car Company in the late 1920s. *John Stewart Collection*

LITE AND NARROW | 15

13. Home-built 20-ton ore cars used at the short-lived Vance Mine in Franklin County, near Russellville, AL. *John Stewart Collection*

was the last operational mine on Red Mountain. Number three closed about 1953. Woodward #3 Tipple, located on the north-west slope of Red Mountain, continued to be used to handle ore that was being hauled, by Euclid trucks, from the Woodward Songo Slope Mine two miles to the east. Songo was located between TCI's #10 and #11 mines. In the beginning, Mines #1 and #2 were served by a narrow gauge tram that was eventually standard-gauged. Mine #3 was reached by a standard gauge switchback from #2.

Red ore mines served via trackage rights

Woodward had other red ore mines that were accessed using trackage rights over two other railroads. Unlike the mines acquired east of Birmingham, these were located close to the Woodward furnaces with railroads already serving them.

LITE AND NARROW | 16

The Songo red ore slope mine was developed by Tutwiler, and sold to Birmingham Coal & Iron, with Woodward acquiring it in the BC&I acquisition in 1912. Originally, Songo had been served by the L&N Mineral North Branch on the north face of Red Mountain. L&N sold these lines to TCI about 1917, which left Songo without L&N service. In a major dispute with TCI over access issues, which resulted in Songo becoming land-locked with no rail service, Woodward was forced to sink a new shaft on the south side of Red Mountain to reach the Songo seam. The Redding Shaft (384 feet deep) was served by the Birmingham Mineral RR's South Branch along the south slope of Red Mountain.

14. This “high line” apparently ran from the surface mine operation to the washer, which was under construction at the Vance Mine in the winter-spring of 1928-1929. *John Stewart Collection*

LITE AND NARROW | 17

When the South Branch line was abandoned about 1933, Woodward had to resort to truck haulage from Redding Shaft to Woodward #3, although they had a right-of-way that could have been developed along the south slope of Red Mountain. In short, the Woodward Iron Company RR didn't access the Redding Mine or the Pyne Mine directly, although there were preliminary plans for access indicated on some maps.

The Pyne Shaft Mine accessed the red ore of Red Mountain in Shades Valley by way of a vertical shaft, instead of a slope that followed the red ore seam from its outcrop near the top of Red Mountain. At 1200 feet, Pyne was the deepest of the red ore mines in the Birmingham district. It was also prone to flooding, and was closed until demand for iron could support the cost of pumping and transportation. The mine was located near the Lacey's Chapel community, and adjacent to the AB&A's mainline from Bessemer to Manchester, GA, so access was via trackage rights on the AB&A. The mine was located six miles from the Woodward Furnaces; however the trackage miles were longer.

When Woodward was founded, it had constructed 180 beehive coke ovens located northeast of the blast furnace. The coal for the coke ovens came from company-owned mines and was delivered by the company railroad. Another component of Woodward's raw materials transportation was coke made from the company's coal. In the early days, Woodward utilized the beehive ovens located northeast of the blast furnace plant. As technology changed, and better, more efficient methods of producing coke evolved, Woodward replaced the beehives with modern coke ovens. This resulted in a coke plant being built west of the blast furnace complex, on the west side of the main line railroad operated by Southern and L&N between Bessemer

and Birmingham. The Woodward Iron Company RR served all of the company's coke ovens.

Birmingham's rail network was complex, as it included trunk lines, short line common carriers, and the industrial private railroads. Although Woodward had a private railroad, their crews were required to cross other lines at junctions. Thus Woodward crews were required to obtain switch keys and interlocking privileges at several locations on the L&N and the AB&A, making for some interesting operations.

Woodward Company's leadership spanned four generations of Woodwards. A very interesting aspect of the WICo RR was that the third president and chairman of WICo. for a number of years, A. H. "Rick" Woodward, was himself a certified locomotive engineer. In fact, he actually was a road engineer for the AB&C Railroad holding #2 seniority for a period of years after 1921. A. H. Woodward had grown up in the company's operations and had become certified as a teenager, apparently starting as a hostler on the company's property. A. H. Woodward kept a close involvement with the company's railroad, as well as the AB&C; he also served on the Board of the Seaboard Air Line RR.

By 1924 the Woodward Iron Company Railroad was six miles long, but an article published in Blast Furnaces and Steel Plant in May of 1924 indicates that the Woodward Iron Company comprised 45 miles of trackage (a figure which presumably included route miles as well as sidings), 12 modern locomotives, and 232 standard gauge cars.

Following the Depression, and during the 1950s and 1960s, the company diversified by acquiring foundries, cast iron pipe foundries, and other types of companies allied to the iron industry. Woodward became a truly integrated iron company in that they produced finished products.

If you look at the history of family-owned corporations, you will see that they do not last more than three or four generations before being bought-out or closing. This was the case for the Woodward Company. After four generations of family leadership, the company was sold to the Mead Corporation of Dayton, Ohio in 1968, when the post-World War II boom in the iron and steel industry was drawing to a close. In less than 10 years after the sale to Mead, the last red ore mine closed (Pyne Mine), iron production ceased, the by-product coke plant was sold, and several firms acquired parts of the Woodward railroad. The Birmingham Southern acquired the three miles between AB&A junction and Bessemer over which it had trackage rights for many years. Birmingham Southern sold a mile to Koppers, the firm that purchased the by-product coke plant and continued to operate it until the 1990s. Drummond, Inc. purchased the Mulga mine, and removed the tracks. Most of the remaining tracks were sold to a firm that removed and sold used rails.

Motive power

Noted rail historian Tom Lawson has provided a summary by wheel arrangement and model of the standard gauge locomotives owned by Woodward Iron Co.:

BUILD A BUILDING, SANDBLAST AN ENGINE ...

IN THIS MONTH'S VIDEO WE COVER BUILDING layouts, sandblasting brass models, constructing a laser kit, and improving freight car performance with aftermarket trucks. We discuss scales, comparing 1/2-inch (1:24) scale to 1:20.3 scale. As usual, there are lots of runbys and extras in the video.

To start this month's "What's Neat" in the magazine pages let's talk about layout construction.

▶ PHOTOS AND VIDEO OF SUPERB MODELS

WHAT'S NEAT | 2

WHAT'S NEAT | 3

1. I have been adding track and making changes on my layout, so I needed to pull off the plywood sides of the layout to change the panel block switch arrangements.

2. I cut a piece of Plexiglas to the size of the new panel and cut holes for the rocker block switches.

Playback problems? [Click here ...](#)

3. I applied thin tape in the pattern of the new track leads, then painted this panel black.

WHAT'S NEAT | 4

4. After removing the tape, I sprayed the back of the panel with gold paint.

5. When you turn it over, you can see the new track arrangement on the panel in gold. It's ready to reinstall on the foam module.

WHAT'S NEAT | 5

6. When it was time to replace the plywood face on the module, I inserted strips of 1/2-inch dimensional lumber so I would be able to staple the sides to the foam. The foam on these modules is about 11 years old and was starting to get soft on the sides. Rather than glue it and have it pull apart later, I chose to use one-inch staples to secure the plywood sides to the wood that was glued deep into the foam. This worked well and held tight. You can see the entire process in real time in the video this month.

[Click here for reader comments](#)

WHAT'S NEAT | 6

7. This month we build the B.T.S. Dodson's Farm Creamery. I'm using it as a hardware supply house for one of my mining towns. I test-fitted all of the main walls before I went back and glued these pieces with wood glue.

8. This model is long and has many sections and docks, so I cut a piece of Plexiglas. This forms a flat base to hold all the components of the structure together – it becomes a one-piece diorama that can be dropped into the layout.

WHAT'S NEAT | 7

9. Using an airbrush, I painted the main walls with Floquil Tuscan paint. My formula is 25 psi of air pressure, and the paint thinned 50 percent.

10. I cut out all the trim pieces and window parts and painted them white, and worked my way around the building. This gave the warehouse some accent color. It looks like a well-maintained structure.

WHAT'S NEAT | 8

11. After finishing the roof sections I was able to test-position all of the kit components together on to the Plexiglas just to make sure everything fit as planned.

12. I used Master Creations cedar shake shingles on the building. I enhanced these sheets with brown colored pencils before installing the shingles. This random effect will look good when the roof is applied.

WHAT'S NEAT | 9

13. Simply peel and stick each row of shingles on to the roof sections. I draw lines on the roof to help keep the rows of shingles even.

14. Here is what the roof looks like with the randomly-colored shingles applied to the cardboard roof sections.

WHAT'S NEAT | 10

15. Turning my attention to the diorama where the building will sit, I used a router and a hot foam cutter to cut away the foam to the depth of the Plexiglas, making for a flush fit. I then glued the building to the Plexiglas base.

16. I laid two siding tracks to serve the building. This track was glued down with Liquid Nails, then painted with Rustoleum Camouflage paint to give the entire area a dull, even tone.

17. I ballasted the track with creek rock and sifted dirt around the area along with ground foam. Everything was glued down with Woodland Scenics scenic cement.

- [TABLE OF CONTENTS](#)
- [INDEX](#)

18. This is how the laser kit turned out. I still need to add steps, ladders, and chimney detail, but all-in-all this kit went together easy and fast with well-engineered design

and precision-cut parts. Now I have another area on the layout to drop off cars and add a little more operation potential to my home layout.

19. This month in the video we discuss model scale and the difference between 1/2-inch (1:24) scale models and 1:20.3 scale models. When I was looking to acquire this 1/2-inch scale brass model there was confusion among my friends whether this was bigger or smaller than 1:20.3 scale. What better way to explain the difference than to show it in photos and video? The 1/2-inch scale model is smaller than the 1:20.3 scale model. The wheel spacing on the 1/2-inch scale model is 3 feet, 9 inches rather than 3-foot narrow gauge, so it can run on G scale track. Just something interesting that you don't see every day.

[Click here for reader comments](#)

Sandblasting models

20. For this month's video tool tips, we discuss and demonstrate sandblasting brass models. Most models come with a lacquer clearcoat. When painted over, this can really cover up a lot of details. Sandblasting the model to remove the clear lacquer makes for a smooth finish with all the detail popping out at you.

When talking to hobby vendors, please remember to mention MRH.

WHAT'S NEAT | 16

WHAT'S NEAT | 17

21. Here you see the inside of my North Coast sandblaster. I am using a full-size ceramic gun with 220 grit aluminum oxide. This size is very fine and will not pit the brass. I used about 50 psi of air pressure during this process. A vacuum system sucks the sand out of the air in the booth to allow a clear view of the work.

22. After blasting the model, I wash it in water from the sink and brush off the loose sand from the model. No matter how much you wash and brush the model, when you place it in the ultrasonic cleaner a dust cloud forms in the bath as all the dust from every crevice starts to float free. Now you have a clean model ready for paint. You can watch the entire process in this month's video in real time.

Improving freight car performance with aftermarket trucks

23. I have this K-37 scale brass model that could not pull four older brass passenger cars up a 4 percent grade. The brass trucks from the '60s don't roll very well and have a lot of drag. The solution was to replace the older trucks with free-rolling new Blackstone aftermarket passenger car trucks, reducing the pulling drag from 1.2 ounces to a half-ounce. Now the locomotive can easily pull the train up the 4 percent to the upper town.

24. I can measure the pulling drag of any given train with this Micro-Mark digital weight scale that allows very fine measurements.

25. I adapted a Kadee coupler to the measuring scale so I could connect it to locomotives or freight cars and measure the dead drag or pulling ability of the models.

WHAT'S NEAT | 20

26. My HO scale 62-car reefer train had a pulling drag of over 4.5 ounces. By replacing the trucks with Kato after-market trucks I was able to reduce the drag of the consist of cars to 2.2 ounces – more than half. Trains now run better with fewer coupler separation problems.

Re-weathering My 35-YEAR-OLD RSC-2

BY BOB RIVARD
.....

[Click here for reader comments](#)

Giving an Alco RSC-2 a facelift ...

BACK IN THE EARLY 1980S I MODELED MY FIRST Soo Line switcher, the 371, an Alco RSC-2. I found a great reference photo of this locomotive in the late Patrick Dorin's book *The Soo Line*. Switcher 371 was originally a six-axle RSC-2, however the Soo re-trucked the locomotive using two-axle trucks which basically made it a dead-ringer for an RS-2. I decided to model the 371 using a Hobby Town RS-2 metal kit.

Back in the day this was about the only way to model one of these Alco switchers. The heavy white-metal body along with a huge flywheel made this engine a very smooth-operating locomotive. However these Hobby Town engines shared one major drawback. The electrical pickup was such that only one set of wheels on each truck conducted current. This made the engine prone to stalling, especially at turnouts.

Fortunately I could rectify this problem a few years later with the introduction of Atlas' fantastic Alco RS-2. The Atlas model allowed the cab and hoods to be separate from the platform, so I simply attached my Hobby Town hood and cab to the Atlas platform. This was important to me because I had invested a lot of time constructing the unique air intake ductwork on the roof of the Hobby Town body.

Utilizing the original heavy metal Hobby Town body combined with the extremely smooth-running (and all-wheel pick up) Atlas mechanism is a recipe for the ultimate-running switcher!

RE-WEATHERING MY RSC-2 | 4

There was, however, one small nagging problem with this engine. Whenever I would come across prototype photos of the 371, I could see that I had applied way too much weathering to my model. My motivation to finally address this weathering issue came when fellow Soo Line modeler Luke Lemmens posted some shots of his 371 on the "Soo Line Models In Action"

1. Here is the shot of 371 I posted on the "Soo Line Models In Action" Facebook site. When I originally weathered it some 35 years ago, I simply applied Floquil Grimy Black using an airbrush. However, through the years I have learned there is much more to capturing the look and feel of correctly weathered Soo Line diesel locomotives. This becomes especially evident on engines painted white! After studying many prototype photos, I soon found it was critical to simulate the effects of dirt and grime that accumulate in the door latches, door seams, and louvers. Also taping around the intake grills before airbrushing exhaust soot is a nice touch.

RE-WEATHERING MY RSC-2 | 5

Facebook site. After posting a shot of my 371, I once again was reminded of my over-weathered model.

At one time many of my models had what I considered too much weathering, which prompted me to come up with a way to remove weathering. Follow along as I demonstrate how I remove and re-apply weathering on a 35-year-old model.

2. I start by using a combination of Turpenoid (an odorless paint thinner sold in art supply stores) and lacquer thinner. I dip a cotton swab into my jar of lacquer thinner and pick up some of the Turpenoid thinner. I wipe off weathering from the surface of the body using my cotton swab. I had a lot of weathering to remove so I switched often to a new swab. I went through at least 30 swabs on this project.

RE-WEATHERING MY RSC-2 | 6

3. This is more like it. I removed quite a bit of weathering from my engine. Using a combination of lacquer thinner and Turpenoid is a very effective way to remove my 35-year-old weathering. I'm not concerned with removing all traces of weathering from the model. Notice how weathering remains in the door seams and latches. This realistically duplicates the look of weathering on a real Soo Line white locomotive. I also take care not to remove weathering from the intricate louvers.

RE-WEATHERING MY RSC-2 | 7

RE-WEATHERING MY RSC-2 | 8

4. By now you probably can see one drawback to using this method. Although using the lacquer thinner is a very effective way to remove the weathering it also removes lettering!
5. All is not lost. Fortunately I have extra sets of Soo Line lettering. Champ set EH 181 was one of the most accurate sets for Soo lettering and numbers.
6. Here is my model after re-applying fresh SOO lettering and numbers to the cab.

7. I'm now ready to add some new weathering, this time not so much. I first apply a quick application of Testors Dullcote. This gives everything a nice dead flat finish and hides the edges of the new decals.

8. I next airbrush a very light application of Grimy Black on the couplers, new air hose and under frame area.

9. I now airbrush some Floquil rust onto the underframe and couplers. Just as on the prototype, this really brings out the details.

RE-WEATHERING MY RSC-2 | 11

RE-WEATHERING MY RSC-2 | 12

10. A common weathering pattern found on prototype Soo diesels were rust streaks on the cab roof. I simulate this effect by using quick passes with my airbrush and Floquil Rust.

11. I next apply a bit of Floquil Engine black around the exhaust stack area.

12. I'm almost finished. I apply some weathering powders to the pilot and trucks. This step is like the frosting on the cake, and provides another important dimension to the weathering process. The powders really simulate that gritty grimy look of the prototype.

RE-WEATHERING MY RSC-2 | 13

RE-WEATHERING MY RSC-2 | 14

13. My final step is to touch a dab of silver paint on the air hose details.

14. Before I head to the layout with my model, I take one last note of how many cotton swabs I used to clean off the old weathering.

15. I ran across this wonderful shot of the 371 on the Fallen Flags website. I noticed a couple of important details I forgot. Almost all Soo line diesels wore a set of re-rail frogs. These frogs on some units were even painted yellow and really stood out. I also added ACI plates which were attached to one of the hand rail stanchions.

RE-WEATHERING MY RSC-2 | 15

16-23. Here is the 371 at the Shoreham sand tower. See the following pictures also.

RE-WEATHERING MY RSC-2 | 16

YES, IT'S A MODEL

compiled by
DON HANLEY
.....

**Click here for
reader comments**

1. A classic VW waits as 5538 slowly leads an eastbound CN freight at the Meurie crossing in Drummondville. Jazz De Longueuil took the picture on his HO scale layout, the Bonaventure & Chambly.

► **MRH'S MONTHLY PHOTO ALBUM**

YES, IT'S A MODEL | 2

2. Rick Sutton posted these photos of Kansas City Southern boxcars. Both models are Tangent X58 boxcars. The 23953 is originally a PC repaint that he re-imagined as one of the many KCS cars seen parked at a favorite railfanning site. KCS 21057 is modeled after a car he photographed. It began as a Norfolk Southern boxcar painted in a basic red/brown color he repainted to cream/white. The rust patterns were created by chipping off the white paint with an X-Acto knife, exposing the original color. The cars are faded with Vallejo Panzer Stencil white acrylic paint, then weathered with Vallejo rust colors and oil paint washes. The graffiti is from decals sourced from Microscale, Weathering Solutions, and various eBay sellers.

YES, IT'S A MODEL | 3

3. A local rancher drives along one of the many unpaved roads common in Utah. It is a slow day on the WP and bored railfan Rob Spangler took the shot as he was waiting for any train to pass by. The photo was taken on the Rob's WP 8th Subdivision layout. To see more of Rob's work visit his wp8thsub's blog mrh-mag.com/blog/rob-spangler.

YES, IT'S A MODEL | 4

4. NYC 56508 was caught during some switching action. Uncounted miles in service left their mark; it is only a question of time until this car will end up in a scrap yard. The car is a Walthers Proto 60' PS single-door boxcar. Andreas Rittershofer weathered the car by partially removing the lettering, then applying a thin coat of light gray to get a bleached look. A fine brush with brown acrylic colors, and lots of time, were needed for the rust spots and streaks. Finally, a coat of matte acrylic varnish seals the results. Andreas photographed the car on his modular switching layout. To learn more visit his site at some-where-southwest.de.

YES, IT'S A MODEL | 5

5. SP VME (Valley Manifest East) is just east of Cliff siding on the La Mesa model railroad club in San Diego, CA. James Patterson took the photo while visiting, and captured the wide vistas the club is known for.

6. The Taggart Transcontinental, falling on increasingly hard times, has partnered with the Gorre and Daphetid to run this branch line. G&D #13 (a.k.a. Emma), was spotted today helping drag a damaged car after an inspection by G&D employees Horace P. Vestibule and Archibald Peter Van Slurp (a.k.a. Arch-Bar Pete). A track hand is supplying some refreshments for the hard-working duo.

Jeff Witt staged and took the photo as a tribute to pioneering modeler John Allen, and a nod to Ayn Rand, author of *Atlas Shrugged*, in which Taggart Transcontinental plays a key role.

Adding
FALL COLOR
to the West Valley Union Railroad

BY MICHAEL WOLF
.....

Harvest hydrangeas to build high-quality foreground trees ...

MY WEST VALLEY UNION IS A FICTIONAL railroad operating in western Pennsylvania. A branch of the railroad climbs into Appalachian coal country, where forests are a dominate feature along the right of way. Because the upper deck

of my HO layout is only about two feet wide, in many areas there is only track and a forested hillside [1]. To produce a convincing scene, I needed a lot of good quality foreground trees at a very reasonable price.

To say that a layout can consume trees in a hurry is an understatement. With nearly 40 square feet of hillside to cover, I didn't know how many individual trees it would take but knew it would be more than a weekend project. By following the techniques below, you can make a tree in less than a minute

that will cost around 10 cents, and is fairly realistic in appearance.

[Click here for reader comments](#)

Inspiration for my future forest came during a local train show about four years ago. At one of the booths, a vendor was demonstrating the use of dried oak leaf hydrangea blooms, Future floor wax, and ground foam to make good-looking trees in seconds. Although I was several years from planting a forest on my layout, I filed away the idea and started looking for a supply of oak leaf hydrangeas.

Oak leaf hydrangeas (*hydrangea quercifolia*) are native to the southeastern U.S. but they are hardy enough to survive in USDA Plant Hardiness Zones 9-5, essentially all but the northern tier states. While the mop head or puffball-shaped hydrangeas are more popular, the oak leaf variety are present in a lot

2. Summer blooms on an oak leaf hydrangea bush.

of landscapes in central Ohio where I live [2]. When dry, the remains of their blooms have a good conical tree shape and plenty of surface area to which foam foliage can adhere.

With permission, I was able to trim the dried blooms from three or four homes and businesses for the last three years. Cutting off the dead blooms does not affect the plant's growth or blooms for the next season – most of them fall off if you don't cut them. I typically wait until several weeks after a hard freeze when most of the plant's leaves have fallen [3]. I have even waited until March, but that risks ice and snow damage to the blooms.

I used a pair of pruning shears to cut the stems and tossed the cuttings into a garbage bag. The garbage bags hung in my garage for up to three years until I got around to making my first round of trees. In total, I harvest two to four bags a year. The blooms are pretty sturdy and don't break down while hanging around waiting to be transformed.

1. Limited real estate for tree covered hillsides near the right of way on the WVU RR.

ADDING FALL COLORS | 5

Don't waste your time on blooms that don't have a lot of seed pockets [4]. There will be just too many holes in the foliage, revealing a foam-covered trunk. That being said, you'll occasionally see some old blooms from the previous year. I think they make pretty good dead trees to mix in to your forest [5].

Many blooms will have a good side and a flatter side. Much like a Christmas tree, they work fine. Just put the flat side toward the back and no one will ever know. Also, if you find a bush with really large blooms, much bigger than the scale you are modeling, definitely harvest them. You can make two trees by splitting the bloom in two and removing some sprigs to expose the trunk of the upper tree [6-7].

Start from the top

When my layout was ready for trees, I started experimenting with my first bag of blooms. The only tool needed for trimming

3. Time to harvest!

ADDING FALL COLORS | 6

4. Don't bother with blooms lacking nice clusters of seed pods.

and shaping is a pair of scissors. While each bloom is unique, I usually start from the top and work down [8]. The goal is to remove any remaining bloom petals and the fine stems to which the petals were attached. Additionally, you can trim away any seed pockets (branches) that don't look right [9]. With very little practice, I was able to pick up the pace and average

ADDING FALL COLORS | 7

5. Blooms that manage to remain on the bush for more than a year make pretty good dead trees.

6. Super-sized blooms.

7. Make two trees from one.

ADDING FALL COLORS | 8

8. A dried bloom ready for trimming.

9. Finished in less than 30 seconds.

almost two a minute. Invite over a couple friends and watch the blooms fly.

I trim the blooms in the garage. There will be plenty of petals, stems and seeds to sweep up when you're finished. Because dipping and coating the trees is messy, I usually prepare several hundred trees before moving to that step [10].

Some of the blooms are very conical in shape and have potential as conifers. Although there aren't many pine trees in the forest areas I was modeling, I set them aside for later experimentation. Since I was doing fall colors, I found some blooms that looked very good "as is" and set them aside for planting.

The original technique used Future floor wax. Today it is marketed as Pledge Floor Care Multi-Surface Finish. While not as

ADDING FALL COLORS | 9

common as it once was, I found it at Walmart for about \$6 for a 27 ounce bottle. I cut the top off of a round plastic orange juice container to hold the floor wax. You're looking for a container just a little larger in diameter than the blooms and tall enough to completely dip the foliage area. A plastic half gallon milk jug with the top cut off also works. You can reuse the leftover floor finish, however, it's best to do large batches since it takes more than a bottle of floor finish to fill the container at the start [11].

Fine foam foliage

The next component is the foliage. Because I wanted fall foliage, I mixed up six or seven different color combinations. I use paint trays and paint tray liners to hold the foliage. A combination of different ground foam products is used. See the materials list.

10. Garage floor covered in trimmed blooms.

ADDING FALL COLORS | 10

11. Container for dipping and the key adhesive ingredient.

Although I've mixed in some Woodland Scenics coarse ground foam, I've found that finer materials work best.

I also use ground dry leaves to save a little money. Lots of oak trees in my backyard provide tons of free material. Each fall I grind leaves in a blender, and not in the wife's good blender! They are the base layer for most of the scenery on my layout. The ground leaves help dampen the intensity of some of the brighter colored foam. In some color batches, leaves make up 30 percent or more of the mix [12].

The last requirement is a place for the trees to dry. I use leftover pieces of foam insulation board. You can pack the trees pretty closely together. I find that a 16d nail works well to make a hole in the foam for the trunk.

ADDING FALL COLORS | 11

Time to dip

This step is messy, so I use a drop cloth. Grab a bloom by the trunk and dip it top first into the floor finish. Just dip the bloom area. The bloom doesn't need to soak in the floor finish, just get it wet. Pull the bloom out of the floor wax and give it a shake to remove any excess. Move the tree to the foam tray and sprinkle it with colored foam. I use a wet hand/dry hand method. I dip and hold the trunk with my left hand and sprinkle with my right hand.

Foam can be applied two different ways – dump or sprinkle. Each produces a different looking tree. With the dump method, simply grab a handful of foam and dump it on the bloom as you rotate it. The foam tends to go on thickly and in clumps. With the sprinkle method, you lightly sprinkle the foam on to the bloom while rotating it.

12. Trays of colored foliage.

ADDING FALL COLORS | 12

13. Dump method (green tree, left), au natural (brown, center), and sprinkle method trees (orange, right).

For blooms with lots of seed pod foliage, the sprinkle method seems to make a lighter, airier tree. The dump method works better for blooms lacking thick seed pod areas. No two trees in nature are the same so experiment and have fun [13]. Give the tree a gentle shake to remove excess foam and “plant” it for drying. The process goes quickly even when working alone and you can easily dip and coat over 100 trees in an hour.

Depending on the amount of coverage area on the blooms, you'll need about one bottle of floor finish for 75-100 trees.

ADDING FALL COLORS | 13

Here's a photo of approximately 500 trees [14]. You can see how tightly I packed them. Also, experiment with top dressing some of the trees with other colors to provide highlights, or to simulate outer leaves changing color earlier or later than the main body of the tree. Of course, even if doing spring or summer trees, you'll want to mix three or four different tones of green and some yellow or lighter green highlights.

While the floor finish has a nice lemon smell, the aroma of five bottles of floor finish is a little more than my layout room and family can handle. I let the trees dry in the garage for a week or two until the smell diminishes or is gone. After drying, planting the trees is easy.

Planting the trees

Most of the hillsides on my WVURR are insulation foam board covered with a single layer of plaster-soaked paper towels. The

14. Approximately 500 trees on the drying rack.

ADDING FALL COLORS | 14

15. Hillside prior to forestation.

plaster is painted with brown latex paint and sprinkled with ground leaves and other ground foam products along the edge of the forest where you see through the trunks [15]. I use a 16d nail to make a hole in the foam and then press the trunk into the hole. The trunks fit tightly in the hole and adhesives aren't necessary, even on mobile layouts. In some areas, I used a drill bit to make a hole in the plaster, rock molds, or the Homasote. After planting a thousand or so trees, most of the upper deck is forested [16].

For the transition area along the edge of the tree line, I use a mixture of clump foliage and unused or poorly formed chunks and branches of hydrangea trees as shrubs and small trees [17].

Distant trees

In two areas on my upper deck, I have distant hills in need of foliage. At first, puff ball trees came to mind because they are

ADDING FALL COLORS | 15

16. Nearly completed hillside of trees.

ADDING FALL COLORS | 16

more than three feet from the viewer and behind some of the foreground trees and industries. However, after calculating how many individual little cotton-ball sized puff balls are required, I looked for another solution. A friend gave me several bags of black fiberfill for making puff ball trees and a new plan emerged – color the fiberfill in place.

I began by stretching about three-quarters of an eight ounce bag of black fiberfill into a thin layer about the size of my first hillside, two by six feet [18]. Earlier, I had re-purposed an old black trampoline mat to become the basic land form over insulation board forms to create the hillside [19-20].

Using a hot glue gun, I tacked the fiberfill to the hillside. It is in a very low traffic area reached by an access hole behind the

17a-17b. Before and after photos along the tree line.

ADDING FALL COLORS | 17

foreground ridge line, so it doesn't have to be as secure as scenery near the front of the layout would be.

I spent a few minutes fluffing and stretching the fiberfill for good coverage and create some undulation to the foliage base [21]. I mixed up several paint trays of foliage color foam similar to the colors used for my trees to prepare for my next scenery experiment [22].

18. Black fiberfill stretched to cover a two by six foot area.

19. Construction of the distant hillside with ridge line in front to hide an access area.

ADDING FALL COLORS | 18

20. Re-purposed black trampoline mat serves as the base for the hillside scenery.

21. The distant hillside has been covered with fiberfill and is ready for hair spray and foam. The clumps of color are chunks of the Woodland Scenics Foliage product. This turned out to be an unnecessary addition.

ADDING FALL COLORS | 19

Then, I donned my dust mask and armed myself with a can of cheap unscented hair spray. Working in a one to two square foot area, I spray the fiberfill with enough hair spray to cause a noticeable mist on the fibers. Then I sprinkle little one to two inch blobs of the various colors. A little hair spray top-coats the foam to glue it into place, and then I move to the next area. Within 30 minutes, I can completely transform about 12 square feet into a pretty convincing distant mountainside [23].

On the right side where the foreground and background trees merge, I used larger puffs of fiberfill and color to transition from individual hydrangea trees to made-in-place fiberfill trees [24].

Correcting bright colors

Pleased with the results of my experiment, I did the same thing on a hillside behind a large mine on the opposite end of the

22. Paint trays with ground foam and dried leaves in various fall color combinations.

ADDING FALL COLORS | 20

23. Finished distant mountainside.

layout [25]. It had a similar black trampoline mat hillside in front of a removable curved backdrop. I used a similar method to cover that hillside, but when I was finished the hillside looked too yellow and bright compared to the foreground trees [26].

I'm not sure if it was because of the lighting in the area or the mix of colors I used but it wasn't good enough for my taste. Fortunately, a quick coat of hair spray, a sprinkling of green foam, and ground leaves toned down the hillside quickly and easily [27]. In this area, there are two front to back transition areas. I started with smaller and smaller pieces and parts from hydrangea trees to gradually transition from hydrangea, to mixed, to puff foliage [28].

The access hatch

One last area remained to be forested. I had made a hatch on the lower level of the layout to access tracks leading to staging [29]. It is sturdy and lightweight, made from foam insulation board, with a thin plaster/paper towel hardshell surface painted

ADDING FALL COLORS | 21

ADDING FALL COLORS | 25

brown [30]. Working with only a few inches of depth, I wanted to transition from the rock cut next to the mainline to a very steep tree-covered hillside.

I begin by trimming the back of a hydrangea tree to produce a flat surface [31]. Using a hot glue gun, I place a glob of glue on the hardshell and hold the tree in place until the glue has set. By carefully selecting the shape of the trees, I am able to piece them together like a jigsaw puzzle to create a thick canopy

31a-31b. A hydrangea tree trimmed flat on one side for better adhesion.

ADDING FALL COLORS | 26

and disguise the fact that there is only an inch or so between the outer branches and the hardshell [32]. The trees and hot glue are pretty sturdy and the hatch holds up well to frequent removals [33].

I mixed up some darker green foam for my pine tree experiment [34]. I think they work fine when mixed in the deciduous canopy, but I'd probably play around with the color palette if I was going to use them in the foreground.

32. The finished hatch.

33. Hatch removed for access to trackwork behind the ridge line.

34. Conifer tree experiment.

There are lots of great techniques for creating realistic model trees. For those who have access to oak leaf hydrangea blooms, I feel they provide attractive, quick and inexpensive trees. Depending on the amount of foam used, I would estimate the cost per tree somewhere around 10 cents. Including trimming and dipping time, you can crank out more than 50-60 trees per hour. Invite a couple of friends over and you'll have a forest before you know it.

My experiments with "foam in place" fiberfill based trees made short work of large areas of distant hillsides. While I model fall foliage on the WVURR, the techniques can be applied to spring, summer or fall depending on your choice of foam color. I welcome your comments.

BILL OF MATERIALS

- Dry oak leaf hydrangea blooms
- Pledge Floor Care Multi-Surface Finish
- Scissors
- Hot glue gun

Various shades and sizes of ground foam:

- JTT Blended Turf - Early Fall, Late Fall, Earth, Yellow Straw, Burnt Grass
- Timberline Scenery Ground Cover/Foliage - Forest Glen, October Orange, Autumn Gold, Cherokee Sunrise, Santa Fe Sunburst
- Woodland Scenics Fine Turf – Weeds, Burnt Grass, Green Blend, Yellow Grass, Earth, Light Green
- Woodland Scenics Coarse Turf – Fall Orange, Fall Rust, Fall Yellow
- Woodland Scenics Underbrush – Dark Green
- Noch Leaves – Light Green
- Dunking container – 1/2 gallon plastic milk jug or juice container with an open top
- Paint trays or other suitable container, to hold/catch foliage foam mix
- Drying rack for trees (foam insulation board)
- Black fiberfill (Putnam Company or others), 8 oz. bag,
- Unscented hair spray, unscented. ■

MICHAEL WOLF

Photo by Lydia Wolf

Michael Wolf's interest in trains began at an early age with Lionel trains at Christmas. In junior high, his 4x8 foot "Christmas Tree Empire" expanded to two sheets of plywood and during his high school years he built his first permanent HO scale layout in a spare bedroom at his grandmother's. College, 23 years as a pilot in the U.S. Air Force, marriage and kids derailed his modeling but his interest in trains remained strong. With military moves behind him, construction

of the West Valley Union Railroad began shortly after moving to Ohio. Thanks to assistance from the Tuesday Night Gang, his modeling and operations skills have expanded a lot in the past six years.

Michael is a corporate pilot and flies around the world. His wife, Julia, a daughter and a son support his hobby, his vacation visits to train-related stuff, and the monthly Tuesday night ops sessions in the basement. When traveling on trips with extended ground time, he travels with a modeling project and his tools. If you find styrene scraps in the hotel carpet, Mike was probably there.

And yes, he is a proud alum of West Virginia University! ■

PREPPING CARS FOR OPERATION

BY JAMES J. EAGER

Easy ways to weight 'difficult' freight cars ...

READY-TO-RUN IS A POPULAR LABEL TODAY, but it isn't always the case. Between building in reliability for operation and following club rules, some work needs to be done on most cars before putting them on the layout. The steps needed are a short list and some cars need more work than others. Even old cars can be brought up to spec, so don't give up.

The first item, couplers, is mostly taken care of on today's cars by the vendors. In 1995, I started converting my cars to Kadees (kadee.com). I took a long-term approach as money was tight – I was on disability at the time – and I had a bunch of rolling stock. I started with one passenger train and worked my way the length of the train over a period of time. I finally finished all the cars last year.

The other thing that the Kadee conversion did was to push me into building an Access database of my rolling stock and including a column to show what coupler is on each car. This same database has come in handy several times, as it provides a ready list on any large conversion by allowing me to add a new column and check off the progress.

With the rise of DCC, some clubs now require the use of metal wheelsets, and I was no exception. I finally settled on InterMountain wheelsets, which seem to work on all my rolling stock, aren't wildly expensive, and come in bulk packs of 100 wheels. See intermountain.com. I finished up that project last year as well.

Car length in feet	Car length in inches	Scale car length in inches	Length based weight	Total weight
40	480	5.517241	2.758621	3.758621
50	600	6.896552	3.448276	4.448276
60	720	8.275862	4.137931	5.137931
70	840	9.655172	4.827586	5.827586
80	960	11.034483	5.517241	6.517241
90	1080	12.413793	6.206897	7.206897
100	1200	13.793103	6.896552	7.896552
110	1320	15.172414	7.586207	8.586207

1. NMRA weight chart for HO in a spreadsheet.

This brings us to the last major item for prepping a car for operations – adding weight. Any discussion of car weighting should start with the NMRA recommended practices. These recommended practices can be found on the NMRA website, (look at nmra.org/rp-201-car-weight). I entered the data into a spreadsheet, as shown [1].

Or, look at the simple graph shown below [2]

For some people, the above information is enough. For others, including me, this is the lowest acceptable weight for any given car. Some cars are delivered from the vendor well short of these weights. For scales other than HO, the formula constant changes, but the concept is the same.

All of the rest of this article applies to other scales as well, but since I model in HO, my examples are in HO scale.

Weight vs length

2. NMRA weight done in graphical form.

3. Commercial self-sticking weights.

For some kinds of cars, adding weight can be easy. For a plain boxcar or any other car that can be opened, but runs closed, you have the whole interior to fill with pennies, washers, BBs, or anything of weight that can be glued down. Alternately, lead weights can be purchased in bars [3] with two-sided tape already on them. Just break the bar at the seam and stick the amount needed inside the car in question.

But what about passenger cars that have big windows and (often) an interior? Or how about getting weight into tank cars, or open top cars like flat cars, hoppers, and gondolas?

In the July and August 2013 issues of *Model Railroad Hobbyist*, I wrote about building the City of Miami passenger train. The seven IHC/Rivarossi cars needed weight, which I added via weight kits that include various jigsaw puzzle weights [4] to place under the car floor.

CAR PREPS FOR OPERATIONS | 5

These weight kits are produced by Adair Shops (adairshops.com). This company specializes in internal car weights and car loads.

Open-door boxcars

After I finished the City of Miami, I found that Accurail (accurail.com) was releasing a nice 50-foot welded box car in my chosen railroad (Illinois Central). So, I ordered a dozen of them, and a set of decals to renumber them. I also decided to open up a few of the box cars to detail the interior. Well, these cars come with a bar weight for gluing to the floor. It looks ugly if you want to open the door. What to do?

The answer is another weight offering: boxcar end weights, and wooden decks originally destined for some flat cars, trimmed to fit. In this case, the end weights [5] are heavier than the original weight bar. I subscribe to the theory of making some cars different to draw the eye towards the cars you do extra work on. Only four cars out of 12 got this treatment. The remaining eight got a lighter weight set, still above NMRA standards. You could stack

4. City of Miami coach weights.

CAR PREPS FOR OPERATIONS | 6

5. Boxcar end weights.

6. Empty Intermountain flat car.

metal washers or pennies in the car ends as well. Just be sure to weight both ends the same.

These cars received palletized loads that can be seen from outside, but that is another article for another day.

Weights for flats

What's next? I am working on wood deck flat cars.

Intermountain [6] makes some really nice flats, including for my favorite road. They were sold years ago as kits, but now you can only get them ready-to-run. Each time Intermountain releases the cars, they make new road numbers. The problem? The flat cars are way too light. These don't even come up to NMRA standard weights, and they tend to jump from the track.

I could tape some weight to the bottom of the car, but it would show. The answer here is to add a permanent load¹. Several

¹ (Editorial comment) Adding a permanent load to a flat car greatly reduces its utility, making it into a one-way-only loaded car in op sessions. Better is to use more clever methods such as adding tungsten (1.8x heavier

CAR PREPS FOR OPERATIONS | 7

companies make flat car loads of metal objects. Adair Shops offers nice steel plates, steel beams, even steel pipe loads. For the do-it-yourself type, get some metal pipe from plumbing supply, cut it to length, paint, and build a wooden cradle [7]. If you build the load as a unit [8,9,10,11], it can be added and subtracted as needed for an op session.

than lead) between underframe members, replacing the underframe beams with metal, using all metal trucks, and wrapping the wheel axles with solder. More on these and still other weighting methods in an upcoming book series called "Make it run like a dream" in 2016. - Joe Fugate

7. Custom wood cradles.

8. First layer of pipes.

CAR PREPS FOR OPERATIONS | 8

9. Second layer of cradles.

10. Second layer of pipe.

11. Fully loaded flat car.

12. Intermountain flat car with metal plate load.

If you want to get really fancy, each car can have different loads for different stops on the op session. The above pipe loads lift right off, and I have a steel plate load to fit the same car [12].

Weighting assembled cars

Next up are Intermountain grain cars and some other closed cars. Can't open them? The Intermountain cylindrical hoppers have a small hole on each end. Small metal bars can be slid into those holes (Adair Shops) or the holes are small enough for BBs, a lot of BBs, in fact. What if there is not a hole? Now is the time to find a drill bit just a slight bit larger than the lead shot you are using. Find a spot where the hole will be hidden and drill into the car. You can cover the hole up later.

The metal bars purchased from Adair Shops for the cylindrical hoppers don't have much room to move by the time you get them in, so fastening them down isn't necessary. I mention lead shot because it is a common solution, but I don't actually have any cars set up that way. Some people affix them, and some probably don't.

Look for ways into a car. I like old "blue box" Athearn tank cars – they're held together by screws. You can easily open them up to add weight inside the tank, either custom weights (Adair Shops), sticky weights, or something else.

Look around for new kits. Before you start to assemble them, look to see where you can install weight during assembly.

13. Adding weight bars to a covered hopper car.

Another unit train I am working on is a set of 16 gondolas. These are another nice kit released by Accurail. Before assembly, I found that Adair Shops has replacements for the metal bars that go under the floor of these cars, adding weight when

swapped in for the weights that come with the kits. But with gondolas and hoppers, you can add loads as well.

14. Gondola with steel beam load.

15. Gondola with pipe load.

Pipe and beam loads are great for someone like me who doesn't want to hide the extra wooden decks I put into the gondolas.² But there are other kind of loads you can add. You can build a wooden plug to fit into the car and glue anything you like on the top – the “trash” gondola load – and can put any amount of weight under the deck. Coal, crushed rock, and sand are options. Let your imagination run – or match it up to the industries your railroad serves.

Finally, you may not be able to weight every car. If this is the case, make sure that the ends of the train have heavy cars and put the light ones in the middle for best operation. For the more detail minded, you may want strapping around some of your loads. Now where did I put that scale chain?

² You can also add weight to open top cars by adding a false deck or false bottom to the inside. If you make the false deck/false bottom out of lead sheet, you automatically get extra weight. - Joe Fugate

JAMES EAGER

James J. Eager has been a programmer and database administrator for several major corporations.

He and his brother each received trainsets which led to a father and sons' layout in the basement, a Model Railroading Merit Badge, and a long-term interest in model railroading.

In 1997, as part of a Jacksonville model railroad club, one of his structures was shown in a TV commercial for the Ronald McDonald House Christmas charity layout at the mall.

James has a long-time interest in the Illinois Central, along with the B&O and ATSF. ■

SOUTHERN PACIFIC'S

Passenger cars:

More than just the Daylight, Part 6

BY V. S. ROSEMAN

Photos by V. S. Roseman
unless otherwise noted

PART 6: MORE HEAVYWEIGHT CARS YOU CAN BUILD

IN PART 5 LAST MONTH, I INTRODUCED YOU to different heavyweight baggage cars you could kitbash or scratchbuild to more accurately model some of Southern Pacific's different passenger trains through the years.

Here in Part 6, I continue looking at other heavyweight cars you can model, as well as provide tips on modeling passenger cars in general. Even if you don't model the SP, you should find these passenger car modeling tips useful.

1. Heavyweight diner Class 77-D-4 (or hamburger grill) kitchen side. Diners and hamburger grill cars were externally similar.

[Click here for
reader comments](#)

Heavyweight dining cars, Classes 77-D-1, 77-D-3, 77-D-4 and 77-D-6 through 77-D-10

The Coast (Morning) Daylight always had first priority for streamlined dining cars. Any other lightweight diners had to be spread

among the Noon Daylight (probably second priority for these) and then other trains. With only a few lightweight food service cars available until 1949, modernized heavyweight cars had to fill in on important trains. Generally, extra sections of the Coast Daylight ran with these older cars, and often times the San Joaquin also had

REMOVABLE ROOF

2. Mounting a removable roof for almost any model passenger car.

COMMON STANDARD PASSENGER CAR UNDERFRAME STRUCTURE

(BASED ON MEASUREMENTS OF S.P. HEAVYWEIGHT PASSENGER CAR)
NOT TO SCALE

3. Common Standard type bar girder underframe.

heavyweight dining cars. A few of these were painted in Daylight colors, while the others were either two-tone gray, or dark olive.

These dining cars rode on various truck types, all with six wheels. 77-D-3 and 77- D-4 class arch roof heavyweights assigned to the San Francisco Overland were painted in UP yellow.

When the San Joaquin Daylight had a collision in 1947, one of its lightweight diners was wrecked, after which one consist was assigned a heavyweight diner and heavyweight lounge car for several years. Eventually, attrition of trains by the early to mid-1960s exceeded the heavyweight dining cars which were sold, scrapped or put into SP maintenance service.

The Rivarossi heavyweight 1920 series heavyweight dining car (Santa Fe prototype), the International Hobby Corp. heavyweight (B&O prototype) dining car, and the Walthers heavyweight diner

COMMON STANDARD PASSENGER CAR UNDERFRAME

AS USED IN SOUTHERN PACIFIC HEAVYWEIGHT CHAIR CARS AND OTHERS

4. Common Standard underframe diagram.

(932-10159) are all similar to the SP's clerestory roof dining cars in classes 77-D-5 through 77-D-10, and any of these could stand in with just a paint job in SP colors.

I have modified some Rivarossi diners to more closely resemble SP prototypes during the streamlined era when they had been modernized with air conditioning. The small single window on both sides of the model should be filled with sheet styrene. Cut a fourth kitchen window, rearrange the kitchen window muntins with one horizontal muntin, and cover the transom windows.

COMMON STANDARD UNDERFRAME ARRANGEMENT

(NOT TO SCALE)

5. Common Standard type bar girder underframe.

The letterboard can be widened by plating it over with styrene strip. The right end of the aisle side of the car (as you face it) should have a fourth large window, and while there is room to cut one, it no longer leaves the wide space between the two sets of windows. Correcting this would require making many cuts into the car and I didn't feel it was justified.

My car is incorrect by one window, the vents at the car ends (which I did not remove), and the door which does not belong on the aisle side of the car. The prototype SP cars have a small window in the same location as the window of the door, and I just left it as it was.

Use .005-inch thick styrene to fill the simulated channel underframe at the bottom of the car sides, although this hardly shows. The fish belly underframe should be cut away and replaced with plastic strip to simulate the bar frame. A shortcut is to cut about

half the material away from the fish belly which comes pretty close to the appearance of a Harriman type bar frame. See the Class 77-D illustration. The letterboard could be made to look smoother if covered with strip styrene as shown in the steps.

To build the arch roof diners in classes 77-D-3, 77-D-4, use two roofs from Roundhouse round roof Harriman cars spliced to fit this car. Cars in classes 77-D-6 through 77-D-10 had clerestory roofs, and if modeling one of these cars, the original Rivarossi roof is used. These cars had narrow air conditioning ducts added over the dining areas, although some cars had their air ducts inside the clerestory. I used strips of Evergreen styrene, sanding these to represent the ducts.

eliminate the heavy rivets, and lightly scribed lines to represent the sheet steel roof, or canvas soaked in waterproofing over the roof. Most of these dining cars were painted dark olive green, but by the 1950s some were painted two-tone gray, and some were even painted Daylight colors.

The Class 77-D-2 has just three large aisle windows (like the Rivarossi model) but the kitchen side is a more complicated arrangement and as these were only ever painted in green I have not included this class.

Some of these cars were modified into coffee shop cars and hamburger grill cars with little if any exterior changes. These ran in various combinations with a regular diner or sometimes a lounge car.

On the San Joaquin Daylight of the 1950s, a diner was often run kitchen to kitchen with a coffee shop car, hamburger grill or another diner. And in peak periods the train sometimes ran 15 or more cars and another heavyweight diner (probably a green one) would be placed further down in the train.

A brief note about painting and the importance of working from photos. In one of the SP Passenger Cars books, (Volume 4, page 134) is a photo of a two-tone gray Class 77-D-2 diner with the top separator stripe and part of the upper light gray letterboard color actually painted several inches into the roof. This was to match the height of lightweight cars with which this car would serve. Not all the cars were painted in this way, so work from a photo whenever you can.

If these conversions are not close enough to the prototype for you, many good brass cars have been made available. The purchase of one or two brass cars is less of a strain on finances than buying a whole train.

17. A 75-CS-2 lounge car as it ran on the San Joaquin, at the Oakland Mole, CA.

Heavyweight lounge car Class 75-CS-4

In the San Joaquin Daylight's 1947 accident at Kingsburg, CA, the lightweight tavern car in one consist was destroyed and was replaced with paired window type heavyweight lounge car #2920, Class 75-CS-4. This car was one of several similar cars to be modernized, and this one had small windows due to the covering of the original transom windows. The other cars in this group had taller windows that reached the letterboard. A composite sketch of each side is shown.

Car 2920 was painted in Daylight colors, and the other cars in the class were two-tone gray or dark olive. Photos show these lounge cars sometimes substituted for 2920. The railroad began scrapping this class in 1957. I have not found any good stand-in for this car, but it generally resembled the Bachmann 10-2-1 sleeping car converted to a round roof. The prototype car ran or was available till it was scrapped in 1956.

SOUTHERN PACIFIC CLASS 75-CS-2 LOUNGE CAR

18. Model made from spliced Rivarossi diners and converted to 75-CS-2 SP lounge car as ran on San Joaquin Daylight starting 1956.

Class 75-CS-2 lounge car for San Joaquin Daylight

Several descriptions indicate that in 1956 a class 75-CS-2 lounge with wide windows and semi-circular bar was assigned to the San Joaquin, but it appears that this may have been a protect car that ran only when needed to replace an out-of-service tavern.

A replica of the class 75-CS-2 car can be made starting with two Rivarossi 1920 series dining cars. The main part of this conversion is to splice the dining ends of the two carbodies. The source cars are each cut at the center and joined with styrene cement, although I suggest adding reinforcements such as styrene strips inside the car. A brass floor epoxied into the car will strengthen it a great deal. Transoms and the center windows are covered with .010 styrene as shown in the photos. One vestibule end from a Rivarossi 1920s

Pullman car is spliced to replace one dining end. Cut off the existing end to match the length of the new vestibule end so the car remains the same length.

A roof antenna with 16 stanchions is added for car 2980. I use .030-inch brass wire for the antenna. I cut the wires into upright supports about 1/4-inch each and tinned one end of each. I drilled the holes for these uprights and inserted the wires. I placed a piece of .060-inch square basswood on the roof as a guide to position these antenna uprights.

The top wire was soldered to the end of the uprights one at a time working from one end. I suggest using a heat sink on each upright as you solder to avoid overheating the roof. Radio Shack has a soldering heat sink clip tool (#276-1567, \$2.49 each) that works well in this application. The Class 75-CS-2 cars were all air conditioned with two-engine Waukesha units.

After adjusting the top wire to be sure it is straight and leveled, I placed a dot of super glue inside the roof at the entry of each wire and let it dry. Then I cut off the excess wire lengths. Lounge furniture is available from Precision Scale, Red Cap and other manufacturers.

While car 2980 was painted in Daylight colors in the 1950s, the other similar cars were either two-tone gray or dark olive green. These were out of service by the mid-1960s and most of them were scrapped.

Clerestory and arch roof 72-foot heavyweight coaches and chair cars

You might think these old-looking cars were the last kind of equipment the railroad would use on a streamliner, but these

were Cadillacs of the rails. These cars rode very comfortably, and many were fitted with reclining seats and updated interiors that resembled those in the new lightweight cars.

Heavyweights like these ran in second sections of the Daylight and wherever lightweight chair cars were not available. These cars were classed as 72-foot (passenger compartment measurement) but their body length was 80 feet overall.

The Walthers paired window coach model (for example, model number 932-10124) represents a Baltimore and Ohio A-18 with York

LOUNGE CAR 2920

AFTER THE 1947 KINGSBURG, CA. ACCIDENT, THE LOUNGE CAR #2920 WAS TO BE ASSIGNED TO THE SAN JOAQUIN DAYLIGHT. OF THE ORIGINAL GROUP OF SIMILAR LOUNGE CARS, THE 2920 WAS ONE OF A FEW THAT HAD THE ORIGINAL TRANSOM WINDOWS COVERED. MOST OF THE GROUP HAD NEW PAIRED WINDOWS OF THE SAME WIDTH CUT THROUGH TO THE LETTERBOARD PRODUCING TALLER WINDOWS. 2920 WAS THE ONLY CAR IN THE GROUP PAINTED IN DAYLIGHT COLORS. A NUMBER OF PHOTOS SHOW TWO TONE GREY CARS WITH TALL WINDOWS ON THE SAN JOAQUIN DAYLIGHT, SUGGESTING THAT OTHER CARS FILLED IN FOR OR SUPPLEMENTED THE 2920. THE CAR OPERATED 1947-1956 WHEN DAYLIGHT PAINTED #2980 REPLACED IT.

THERE IS NO EASY CONVERSION TO BUILD THIS CAR. A REASONABLE STAND IN WOULD BE THE SPECTRUM 10-2-1 PULLMAN (SEE THE 8-5 SLEEPING CAR STAND-IN FOR THE STARLIGHT WHICH SHOWS THE SPECTRUM SLEEPING CAR FOR COMPARISON)

21. Sketches of 75-CS-2 car 2920 that ran on San Joaquin Daylight 1947-1956. There is no model of this car but either a Rivarossi 1920 series Pullman or Spectrum Pullman car fitted with round roof could be used as a stand in (see [20]).

air conditioner and air duct inside the upper clerestory. This is a typical 80-foot coach resembling clerestory roof cars. These cars were painted SP Dark Olive green until the mid-1950s, when many were repainted in two-tone gray.

SP cars 1048 and car 1051 in Class 70-C came to the SP from the El Paso & South Western RR in 1924. These cars received tall windows with no transoms when modernized, giving them the appearance of this model. These prototype cars had full-height doors as on the model. More typical SP cars can be modeled by cutting out the

WINDOW CONFIGURATIONS OF SP 70 FOOT COACHES

A

B

SP CARS COACHES AND CHAIR CARS WERE BUILT WITH A TRANSOM OVER EACH WINDOW PAIR.

BY THE 1930S THE TRANSOMS WERE BEING PLATED OVER.

C

D

IN 1927 SPECIFICATIONS FOR COACH AND CHAIR CARS WERE CHANGED . TALLER WINDOWS WITH WIDE LETTERBOARDS AND WITHOUT TRANSOMS WERE NOW INDICATED. THE FIRST GROUP OF CARS AFFECTED WERE THE 72-C-5 ARCH ROOF CARS. THIS PRACTICE CONTINUED WITH THE CLASS 73-C-1 CLERESTORY ROOF COACHES. SOME OLDER CARS WERE REBUILT WITH THE TALLER WINDOWS.

THE NINE EL PASO & SOUTH WESTERN RR. CARS ACQUIRED WITH THAT RAILROAD IN 1924 WERE BUILT WITH TRANSOM WINDOWS. WHEN REBUILT IN LATER YEARS BY THE SP, CARS #1048 AND #1051 RECEIVED THE TALL WINDOWS SIMILAR TO THE SKETCH ABOVE.

22. Sketches to show various configurations of SP coach and chair cars.

doors and extending the letterboard with styrene, then adding new low doors cut from styrene sheet.

Many or all Class 72-C-1 through 72-C-4 arch roof cars built for Southern Pacific were modernized, some receiving tall windows like the Walthers model. The model could be converted to resemble these earlier coaches (chair cars) by fitting an arch roof made by splicing the roofs of two Roundhouse-Athearn round roof cars.

The SP's clerestory roof chair cars beginning with Class 73-C-1 were built with full-height windows and rode on six-wheel trucks of Class 6-TC-6.

Some of the SP coaches and chair cars (including the former EP&SW cars) received ice air conditioning beginning in 1936.

Most of the clerestory roof cars had narrow external roof mounted air conditioning ducts. See sketch in the heavyweight diner section above. Some had an air conditioning duct inside the clerestory which did not show on the outside of the roof.

Ice air conditioning boxes are available from New England Rail Service. Some cars received Waukesha air conditioning systems, and HO scale parts are available from Train Station Products, Palace Car Co. and Precision Scale Co.

COACHES AND CHAIR CARS BUILT FOR
SOUTHERN PACIFIC HAD FULL LENGTH
LETTERBOARDS AND LOW DOORS

For a full listing of these cars' number series and details see "Southern Pacific Passenger Cars Vol. 1- Chair cars and Coaches," published by SP Railroad Technical Historical Society.

8 section-5 double bedroom sleeping car for the Starlight and others

In the 1930s and 1940s The Pullman Company rebuilt a number of older heavyweight sleeping cars into diagram 96, plan 4036, (with various sub letters indicating minor differences to the interiors)

with 8 sections and 5 double bedrooms. Southern Pacific was assigned this type of car, operated by Pullman crews.

In the breakup of the Pullman Company in 1948, the SP received 15 of these cars that had "Clover" names. The cars were all equipped with Pullman Mechanical air conditioning systems, and it appears

24. Walthers paired window coach stands in for ex-El Paso Southwestern cars absorbed by SP, car 1051. Also can stand in for various classes of SP 75-foot coaches.

that most or all cars came with auxiliary brine tanks in the air conditioning systems. The brine caused corrosion problems and the tanks were removed between 1948 and 1953. In 1956 and 1957 the car names were removed and replaced with SP numbers 8350 to 8363, plus T&NO 819 and 820.

The Pullman name was painted out by the mid-1950s and replaced with Southern Pacific lettering in the letterboard and small "Pullman" at both letterboard ends. Some cars were painted dark green with imitation gold lettering, and some were two-tone gray with pale gray lettering. The cars all rode on Pullman type 2410A six wheel trucks, except #8361 which had type 1910 trucks, and car 8356 which had type 242 trucks.

8 SECTION- 5 BEDROOM SP PULLMAN SLEEPING CAR FOR STARLIGHT
SHOWN WITH SPECTRUM 10-2-1 MODEL AS A "STAND IN" CAR

8-5 SOUTHERN PACIFIC CAR "CLOVER SERIES" THAT RAN ON THE STARLIGHT AND OTHER SP TRAINS.

SPECTRUM HO MODEL OF 10-2-1 PULLMAN CAR AS A STAND IN FOR THE 8-5 CAR

SP 8-5 CAR (VESTIBULE RIGHT)

SPECTRUM HO MODEL OF 10-2-1 PULLMAN CAR AS A STAND IN FOR THE 8-5 CAR

IT IS POSSIBLE TO BUILD A MODEL 8-5 PULLMAN CAR, BUT IT WOULD REQUIRE MANY CUTS TO REASSEMBLE THE WINDOWS. YOU NEED TO DECIDE IF THAT MUCH WORK IS WORTH IT TO HAVE THE CORRECT CAR, OR IF THE OUT-OF-THE-BOX SPECTRUM MODEL IS CLOSE ENOUGH TO STAND IN FOR THE CORRECT CAR. NO PLASTIC MODELS OF SINGLE-ENDED PULLMANS OTHER THAN THE SPECTRUM MODEL ARE AVAILABLE AS OF THIS WRITING.

27. SP "Clover" series named 8 section- 5 double bedroom sleeping car compared to possible stand-in car, Spectrum HO 10-2-1 sleeping car.

This prototype model is available from Precision Scale model in brass, but no plastic model is available. Unfortunately, to make an 8-5 from any of the available plastic models would require a great deal of cutting and fitting. The fact that the 8-5 car is a single vestibule type causes additional complications for modelers.

The only plastic model resembling an 8-5 that could stand in for this car of is the Bachmann-Spectrum 10 section-2 double bedroom-1 drawing room car. Another alternative would be to model the periods when the Starlight ran with a 12 section 1 drawing room sleeper which is available as a plastic model, instead of an 8-5.

In Part 7 in November, I'll show lightweight cars you can construct, as well as provide some lightweight stand-in equipment options. ✓

VICTOR ROSEMAN

Victor got his first train, a Lionel, at age 3. Victor graduated from the Pratt Institute with BFA and MS degrees and taught fine arts in high and junior high school for 30 years and is now retired.

Victor has written many articles and several railroad related books over the past 35 years. He's also done many freelance projects for Walthers, Atlas and other model manufacturers.

AN EASY WAY TO CLEAN WHEELS

BY BRENT CICCONE

1. Brent built this cloth strip wheel cleaning apparatus using some music wire and some brass tubing mounted in the roadbed.

[Click here for reader comments](#)

AS A FOLLOW UP TO MY ARTICLE IN THE JULY 2014 MRH about track cleaning, here's an easy way I use to clean wheels.

The advantage of this method is that it cleans *all* the wheels whether powered or not. In fact you can run all of your cars through and clean the wheels on all of them. It doesn't work too well if they are really dirty, but if used periodically, it will help to keep all the wheels on your rolling stock clean.

Just a disclaimer: I didn't invent this method. It has been around for years and you can find other YouTube videos showing the method, but here is my version. Dimensions don't

Playback problems? [Click here ...](#)

matter too much. Make the cloth strips about the size of the engine trucks. If you make it too wide it will stall on the strip. If it's too narrow and there isn't enough surface for cleaning. I find around 1 ½ - 2 inches works in HO scale.

I used 3/32" steel spring wire or music wire, the same stuff you would use for controlling turnouts, to anchor the strip. I installed some 1/16" brass tube in the roadbed for holding down the ends of the wire.

The cloth used doesn't really matter, but you don't want anything too thick, or anything that releases lint.

Every so often I hook up a long train or two with all my cars and locomotives in it and simply run them a few times over a cleaning cloth soaked with my favorite wheel cleaning solvent (acetone).

You might incorporate cleaning the wheels into your normal operations or add it as another task for your operators to do. Back in the day, passenger trains were required to go through the car wash, so you could make this part of the task to be done when leaving the station!

New Layout Underway at GATSME Club

GATSME Model Railroad Club, Rockledge, Pennsylvania, is open to new members, especially those interested in helping develop a new club layout. Following the loss of their 35-year residence, the club was able to purchase a 4800-square-foot mill building in Rockledge Borough. Now the work begins on planning and building a museum-quality HO scale layout that will feature the best and latest practices of model railroading. The new facility includes a museum that will pay tribute to Rockledge's history as the location of several knitting mills, all now gone except for GATSME's present building. For more information visit gatsme.org or contact Doug Baer at Dbair@polarmicro.com.

NEW CLUB CARS

NMRA's Northern Utah Division is selling a kit for a 40-foot plug-door steel refrigerator car decorated for Fisher Beer. The basis of the HO scale

model is an Accurail 8500-series car. The design of the fantasy reefer is based on logos from an actual Fisher Beer bottle dating from the 1950s-1960s. For additional information including ordering instructions send an inquiry to Stan at RJenn24103@aol.com.

NEW PRODUCTS FOR ALL SCALES

Clever Models continues to release creative new cardstock model kits. Among the latest downloadable kits are the combination Coal/Grain Elevator illustrated here. When assembled the dimensions of the main structure are 53 feet wide x 22 feet deep x 48 feet 6 inches tall. Instructions and photos are included in the download. This file comes in O scale with instructions to print in any

smaller scale. Other items currently under development are a mill and a line of modern steel buildings. For additional information visit clevermodels.net.

London Web Software has announced their TRIM 2D Building Designer and TRIM 3D Building Designer programs. Available for PC or MAC, these programs are used to design structures created using the Linka and ScaleCast molds system. Projects can be prototyped on the computer, creating a plan to be used in building the actual model. More information can be found at londonwebsoftware.com.

New releases from **Morning Sun Publications** includes *Erie Lackawanna Through Passenger Train Service Volume I: 1960-1965* by John J. Boehner. This is a digital reprint of

the popular hardback published in 2006. Additional digital releases include *Rio Grande: The Best of Bob Davis*, and *INSULL Chicago Interurbans* which has more than 300 color photos of the Chicago Aurora & Elgin; Chicago, North Shore & Milwaukee; and Chicago South Shore & South Bend.

New traditional hardback books include *Chicago & North Western Power 1963-1995 Volume 2*, by Stephen M. Timko. Also new from S. M. Timko is Conrail *Central Region Volume 2 1981-1986*. And finally *Chessie System in Color*, in which author Bob Withers provides readers with an in-depth look at the colorful Chessie System including ample photos of the famous feline's silhouette that appeared on everything from locomotives to cars, trucks, and belt buckles. For additional information visit morningsunbooks.com.

O SCALE PRODUCT NEWS

During the second quarter of 2016 **Atlas O** plans to release another run of its 53-foot Evans insulated RBL boxcar (item

301318). Features on the O scale model include Dreadnaught ends and double Superior plug-doors. New road names will be Alaska Railroad, and Western Pacific. Road names scheduled to be rerun with new numbers include Minneapolis, Northfield & Southern; Burlington Northern; and Illinois Central.

Also scheduled for release during the second quarter of next year is a PS 4427 low-side triple-bay covered hopper car. New paint

schemes include ATSF "Q", Illinois Central Gulf, WC/CN, and Union Pacific. A popular Chessie System car will be rerun with new road numbers (item 3001359-62). All Atlas O models are available for either two-rail or three-rail operation. For additional information visit atlaso.com/nowshipping.htm.

Identified as the Littlefield & New Paltz railbus, the new model is designed to fit a Bachmann HO

Boulder Valley Models is selling a body kit for an On30 railbus. Identified as the Littlefield & New

scale 45-ton locomotive mechanism (not included). The kit includes detailed cast resin body parts for the sides, ends, hood, radiator, roof, headlight, bell, and steps. Illustrated instructions show how to extend the deck of the Bachmann loco to allow a pilot and coupler at each end. For additional information visit bouldervalleymodels.com.

HO SCALE PRODUCT NEWS

New HO scale kits recently released by **Accurail** include a 50-foot double-plug-door boxcar decorated for Toledo, Peoria & Western (item 5414).

Also new is a Pittsburgh & Lake Erie 70-ton triple-bay hopper car with offset sides (item 7554).

Kits for ACF triple-bay covered hoppers decorated with CSX *How Tomorrow Lives* slogan are available in a three-car set with different road numbers (item 8066).

SEPTEMBER NEWS | 6

This Milwaukee Road 40-foot wood stock car with Murphy steel ends is available now from Accurail as an easy-to-assemble kit (item 47041). For more information on all Accurail products visit accurail.com.

.....

Athearn has issued a long list of HO scale items scheduled for release next summer. Leading the Genesis list is an SD75M diesel decorated for Norfolk Southern (item 69215-18). The model is based on former ATSF and BNSF units acquired by NS last September. Spotting features include a turbo bulge, early dynamic brake grilles, Nathan five-chime horn, two grab irons on the cab roof, tinted cab windows, nose door with window, short sunshade brackets, four-step walkway, drop-style grab irons on rear pilot, early jacking pads, round-top ditch lights, and late-style 5,000-gallon fuel tank with a stem-mounted fuel gauge. Four road numbers will be offered (2800, 2802, 2805, and 2806). Standard DC models without sound will have an MSRP of \$199.98. Models with Tsunami sound and DCC decoder will list at \$299.98. Availability is July 2016.

A new release of Genesis MP15AC locomotives (item 69400-12) will be available next June. In addition to an EMD

SEPTEMBER NEWS | 7

Demonstrator, road names will be Southern Pacific (faded paint), Ferro Valle Railroad, and CSX/YN2.

Next June will also see the arrival of class F89 TOFC flat cars. Road names on the HO scale Genesis series model will be ATSF (above), TTX Trailer Train, Southern Pacific, and KCS (item 69945-59).

Athearn HO scale Ready-to-Roll models scheduled for release in June 2016 include 40-foot tri-

ple-bay hopper cars with side extensions and a removable wood chip load. Road names will be Missouri Pacific, Bangor & Aroostook, Boston & Maine, Chesapeake & Ohio, Norfolk Southern, and Chattahoochee Industrial Railroad (item 76480-97). The cars will be sold individually as well as in four-packs with different numbers.

A 65-foot 6-inch mill gondola with working drop-ends and individually applied wire

grab irons will also be ready for release next June. Decorating schemes will be Chicago, Burlington & Quincy; Canadian National; Penn Central; Southern Pacific; and Union Pacific (item 76543-60).

Four new Athearn-Roundhouse-branded

Ready-to-Roll series models are scheduled for release in June 2016. Leading the group is an EMD F7A that will be offered separately as well as in F7A/B matched pairs with only the A unit powered. Road names will be Pennsylvania Railroad, Canadian National, Canadian Pacific, and Southern Pacific in the Daylight scheme (item 87903-10).

Pullman-Standard 2003 cu. ft. twin-bay covered hopper cars decorated for Santa Fe, Conrail,

Milwaukee Road, Trona Railroad, Norfolk & Western, Southern Pacific, Union Pacific, and GE Lamps (96149-72) are also scheduled for release next June.

Athearn-Roundhouse 40-foot wood reefers with steel

underframe and Dreadnaught ends are included in the June 2016 release. In addition to the North Western Refrigerator Line car shown here, the Ready-to-Roll HO scale models will be

available decorated for Green Bay & Western, Northern Pacific, Rock Island, Soo Line, and PFE with dual SP and UP heralds (item 85610-27).

Completing the Athearn-Roundhouse release schedule for next June is a steel

cupola caboose. Road names will be Southern Pacific, Santa Fe, Burlington Northern, Canadian National, Canadian Pacific, and Pennsylvania Railroad (item 87818-35). For additional information on Athearn products contact a dealer or visit athearn.com.

Atlas Model Railroad Company plans to release a Masterline series 10-section, one-drawing-room, one-compartment Pullman sleeper (item 20003612-631) during the first quarter of 2016. Features on the HO scale model include operating diaphragms, complete underbody detail, and full interior detailing including window glazing.

Eighteen decorating schemes will be available including Burlington-Pullman (green – Carter Lake, Linoma Lake); Chicago & North Western (green and yellow – Floyd River, Fox River, Mount Rushmore); Norfolk & Western (Tuscan red – Island Regal, Island Rose); Northern Pacific (two-tone green and

yellow – Chief Black Bear, Chief Many Horns, Chief Standing Buffalo); Pennsylvania Railroad (Tuscan red – La Reine); Southern Pacific (two-tone gray – Palouse Falls, Prior Lake); Union Pacific (yellow, gray and red – Balsam Fir, Columbia Gorge, Crown Point); and Pullman (green – Chief Red Tomahawk, Blue Bird Lake, Rice Lake). An undecorated model is also planned.

More models coming from Atlas during the first quarter of 2016 include another production run of its 53-foot Evans insulated RBL boxcar.

Features on the HO scale model include Dreadnaught ends and double Superior plug-doors. New road names will be Roscoe, Snyder & Pacific; Alaska Railroad; Brooks Scanlon; Fox River Valley; and States Veneer. Rerun road names with new numbers include Minneapolis, Northfield & Southern; and, as seen here, Bend Millwork Co (20003423-439). An undecorated model will also be available.

Completing Atlas' first quarter release of HO scale models is a Trainman series steel cabooses with a centered cupola. The model is based on a prototype Magor Car Corporation delivered to the Chesapeake

& Ohio in 1937. The design proved popular with hundreds of similar cabooses produced by American Car & Foundry

and the St. Louis Car Company. Through subsequent rebuilding and modernization, many remained in service until the end of the cabooses era in the 1980s. Atlas' ready-to-run model has clear window inserts and separately applied side railings. New road names will be Genesee Valley Transportation, Jersey Central, Lehigh Valley, Reading & Northern, Southern Railway, and Union Pacific. New numbers will be available for Alaska, Canadian National, CP Rail, CSX, and Virginian (item 20003671-690). For more information go to atlasrr.com.

Bachmann Trains has updated its 80-foot Pullman sleeping cars with improved coupler pockets and constant amber-LED lighting. Other features include diecast trucks with low-friction eight-wheel electrical pickup for the lighting system which will function on both DC and DCC systems. Road names for the HO scale ready-to-run model are Pennsylvania Railroad (Edisonville), Santa Fe (Moose Lake), Baltimore & Ohio (Loch Lomond), New York Central (Mohawk), and Union Pacific (Lake Waccamaw). For information on all Bachmann products visit bachmanntrains.com.

Broadway Limited Imports is scheduled to release its HO scale version of a Pennsylvania Railroad class L1s 2-8-2 Mikado steam locomotive this month. Both pre-1946 and post-war

versions of the L1s will be available, as well as identical models decorated for Detroit, Toledo & Ironton; and Lehigh & New England.

BLI expects to deliver this HO scale version of a Union Pacific 4-8-8-4 Big Boy next January. The prototype fulfilled UP's need for a locomotive capable of handling a 3,600-ton train

over Sherman Hill and the 1.14% grade from Ogden to Wasatch, Utah without the need of helpers. Both of these steam locomotive models feature BLI's Paragon3 Sound & Operation System. For additional information on all BLI products contact your dealer or visit broadway-limited.com/products.aspx.

Dallas Model Works has introduced a new series of HO scale pre-weathered brass

wheelsets. Although the face of each wheel is covered with grime, the axle ends and wheel treads are clean. Both 33-inch and 36-inch wheel sets are available. Weathered N scale wheelsets are scheduled for release later this year. for additional information visit dallasmodelworks.com.

Dr. Ben's is selling a Scale Model Masterpiece kit identified as the Short Line Freight Shed & Boiler. The kit was originally created by Thomas A. Yorke Enterprises. The structure features a free-standing vertical boiler and stone remnants of what was once

a boiler room, plus miscellaneous boxes, barrels, and stacked sacks. Labstone dental material is used to make the detailed casting using original Thomas A. Yorke master/molds. The plastic windows, doors, and other details are Grandt Line Products. Additional components include scale lumber and Doctor Ben's roofing material. Updated instructions reflect changes of materials and advances in modeling techniques, including detailed construction drawings, templates, weathering instructions, and color photos of the completed models. For additional information visit debenllc.com.

The latest kit from **Fine Scale Miniatures** is Westside Auto, a multiple-structure small-town auto parts dealer. This limited-production HO scale craftsman-type kit is scheduled for release

SEPTEMBER NEWS | 14

in late September. When assembled as shown, the completed scene has a footprint of 9.5 inches x 15 inches. Vehicles and figures in the display photo are not included. The kit is priced at \$265.00. To order visit finescaleminiatures.com.

Fos Scale Models has released a kit for Darnell's Auto Body. The assembled model has a footprint of 4 inches x 11 inches. Vehicles and figures in the display photo are not

included. The HO scale craftsman-type kit is priced at \$114.95. For additional information visit foslimited.com.

Imperial Hobby Products has HO scale body shells for an NYCTA Budd R32 subway

car. The floors are configured for drop-in installation (after some drilling and tapping of screw holes) in a Bowser mechanism and trucks (not supplied). For complete details on this project including ordering information visit ihphobby.tripod.com.

InterMountain Railway plans to release a new production run of its HO scale General Electric U18B light road switcher early next year. Road names will be New Haven, Central

SEPTEMBER NEWS | 15

Vermont, Southern Pacific, Frisco, Maine Central/PanAm, Chessie System, Burlington Northern, Rio Grande,

Delaware & Hudson (bicentennial) Western Pacific, Great Northern, and SP/SF in the Kodachrome scheme (item series 49480-492).

The locomotive can be ordered with either FB-2 or Blomberg trucks. A DC version of the ready-to-run model will have

an MSRP of \$189.95. Models equipped with an ESU sound decoder will list at \$279.95. Other options include an undecorated kit with a full drive system at \$149.95, and an undecorated body only at \$79.95.

Also due from InterMountain in February-March is a new release of a 57-foot class R-70-20 mechani-

cal refrigerator car. Nine decorating schemes will be available including BNFE (white body), SPFE (white body with blue medallion), SPFE (restenciled), Soo Line, and UPFE (R-70-25). Also PFE cars with either a Keystone or Hydra-Cushion underframe and a choice of an early or late roof. Features of the HO model include metal wheelsets and Kadee couplers.

It has been several years since InterMountain made a production run of its HO scale Procor pressure-flow covered hopper car. A release has been scheduled for March-February with

SEPTEMBER NEWS | 16

cars decorated for Procor, Halliburton, British Columbia Railway, AAR-ex BCOL, Stelco, Mountain Minerals, and La Farge

Cement LAFX. The ready-to-run models will have Kadee couplers and metal wheelsets at an MSRP of \$49.95. Meanwhile, an undecorated kit with plastic wheels and no couplers is available now at \$19.95.

Kadee Quality Products has introduced an 11,000-gallon insulated tank car that adheres closely to a prototype car with a riveted underframe

as built by American Car & Foundry. The car has a step platform from the 1947-1949 period. Features include see-through Apex safety platform and running boards, complete underframe details including AB brake system and rigging, defect card holders, and hazardous materials placard stickers. Rather than being molded in place, all of the individual details are cast separately and hand-applied.

The model has the usual Kadee features including HGC self-centering two-piece equalized trucks and #158 Whisker couplers in a narrow draft gear box with delayed centering action. The initial release is decorated for TWOX 4003 - Tidewater Association Oil Co. The ready-to-run model has an MSRP

SEPTEMBER NEWS | 17

of \$44.95. For additional information see your dealer or visit kadee.com.

KatoUSA has introduced four new sound cartridges for its Analog Sound Box system. They include FEF-3/GS-4 heavy steam sound; US light-steam sound; EMD third-generation diesel sound; and GE third-generation diesel sound. To hear the sound cards in action visit [youtube.com/watch?v=u_9Q45odq4E](https://www.youtube.com/watch?v=u_9Q45odq4E). Kato's Analog Sound Box has been developed as a joint effort by Kato and Soundtraxx to provide an effective sound system for non-DCC layouts. For information about the system visit katousa.com/news/newsletter/August15-News.html.

Q Connection has acquired a variety of HO scale parts from former brass importer Railway Classics. The parts include trucks and full-width diaphragms used on Milwaukee Road and Northern Pacific streamlined passenger cars. For additional information visit QConnection.biz. The acquisition included passenger car decals which are noted in the Decal section near the end of this News Report.

Rapido Trains has released information about its forthcoming HO scale model of the Alco/MLW FA-2 (freight version) and FPA-2 (passenger version) diesel locomotives. A total of 283

SEPTEMBER NEWS | 18

FA-2 and FPA-2 locomotives were built by Alco in Schenectady, New York, with an additional 51 units being built under license by Montreal Locomotive Works. The contour of the roof and nose are expected to be precisely accurate, since the tooling is being prepared from a 3D scan of a full-sized prototype.

Notable features on Rapido's HO version include operating number boards, headlights and two-color class lights (white/green); dynamic brakes; etched-metal grilles (chicken wire or Farr grilles as appropriate to road name); full underbody piping and conduit; road name specific fuel tanks; separate grab irons and handrails; and full cab interior. Both DC and DC/DCC/Sound models will be available with authentic ESU LokSound recordings from a real Alco 244 prime mover.

Rapido plans to replicate all of the most visible differences from railroad to railroad including such variations as water/fuel tank combinations, steam generator roof panels, vertical battery box louvers, side grilles, nose louvers (B&O), Trainphone antenna (PRR), and other prototype-specific details. The model will have an MSRP of \$225.00 (DC) and \$325.00 (DC/DCC/Sound). The MSRP in Canada may increase slightly depending on the value of the Canadian dollar at time of delivery.

SEPTEMBER NEWS | 19

For a preview of how the Rapido FA-2 and FPA-2 will look and behave, visit youtube.com/watch?v=wng1gkaWZDg&feature=youtu.be.

Road names on the initial production run will be Baltimore & Ohio, Canadian National, Canadian Pacific, Canadian Pacific (script), Erie, Great Northern, Lehigh Valley, New York Central, and Pennsylvania Railroad. An undecorated model will also be available. For additional information about Rapido's FA-2 and FPA-2 locomotive project including making a reservation visit rapidotrains.com/fa2.html.

Rusty Rails has introduced two new HO scale scenic junk castings. Shown on the left is an old engine bone yard (item RRJP-H-22) that measures about 5.5 inches x 4 inches. On the right is a pile of junk for a foundry or similar industry (RRJP-H-35) that measures 3.75 inches x 3 inches. The resin castings are sold unpainted. For additional information visit rustyrails.com.

Tahoe Model Works offers a wide selection of HO scale freight

car trucks that faithfully replicate the prototype. Trucks available now range from circa-1890s ACF arch bar trucks with a 5-foot wheelbase (left) to 70-ton A-3 trucks from the late 1940s (right). Tahoe trucks are available with RP-25 or .088" semi-scale wheels. Although Tahoe does not maintain a website, details on the entire line including ordering information is available at sunshinekits.com/sunimages/tahoe/ORDERFORM15s.pdf.

Tangent Scale Models has released a new production run of its General Steel Casting 60-foot flat car. The HO scale model replicates a one-piece cast steel frame prototype developed by GSC in 1956. The ready-to-run model features Tangent's usual attention to detail such as wire grab irons, wire uncoupling bars, air hoses, and prototypically accurate roller or plain bearing trucks as appropriate to the road being modeled.

Six road numbers each are available

now for Burlington Northern (1985 repaint in cascade green), Illinois Central Gulf (1977 orange repaint), Missouri Pacific (1981 eagle and buzzsaw repaint), Pennsylvania Railroad (1965 original F47 paint), and Union Pacific (original 1966 armour yellow paint). Four road numbers are available for two Missouri Pacific MOW cars in UP MOW green: post-2005 scheme and pre-2005 scheme. A Great Northern version is

available in three road numbers decorated in the original 1963 glacier green scheme. For additional information visit tangentscalemodels.com.

Also new from Tangent are assorted detail items identified as "Unique and Useful Parts." The items include Plate ACI Labels (in packs of eight), Raised Plate ACI Labels (in packs of eight), Manitoba placards (in packs of four), and Coupler Lift Levers (in packs of five pair). For additional information including photos of the items visit tangentscalemodels.com/product-category/unique-and-useful-parts.

Walthers is quoting a late November delivery date for it's

HO scale B&O Capitol Limited E9A diesel locomotive (920-48370). Special features include raised B&O Capitol Dome herald, a brass Nathan M5 air horn, single headlight with flush lens and gasket detail, flush number boards, ATS shoe on front truck, stainless steel Farr side grilles, and fuel tank skirts.

Also due from Walthers in late November is a five-unit spine car that is 263 feet in length (910-5257). The individual cars are 48 feet in length. The cars

can handle trailers from 28 feet to 45 feet in length, or containers from 20 feet to 48 feet long. Details include collapsible container pedestals, upright and closed trailer hitches, and brake gear details on the end cars. The Mainline series model will be available for Santa Fe, Burlington Northern, Conrail, Union Pacific, and TTX as shown here. The HO scale model will have an MSRP of \$119.98.

This 70-foot RPO-baggage car decorated for the Pennsylvania

Railroad (920-9240) with Tuscan body, black roof and Dulux lettering is scheduled to be released by Walthers in March 2016. For additional information on all Walthers products, contact your dealer or visit walthers.com.

Yarmouth Model Works is selling resin kits for HO scale 40-foot ATSF 12-panel boxcars. Separate kits are available for three different versions of the prototype: 1) with a square panel roof and a

Trilock metal running board, 2) with a diagonal panel roof and a Trilock running board, and 3) with a diagonal panel roof and a USG metal running board. Each kit includes specially designed etched detail parts, Kato ASF A-3 trucks, and Speedwitch Media decals which contain all of the slogans for both Map and Ship and Travel decorating schemes. To order visit yarmouthmodel-works.com/kits.php.

Pierre Oliver, owner of Yarmouth, has dedicated this series of kits to the memory of Richard Hendrickson. In announcing the dedication, Oliver said, *"He (Hendrickson) was the grand man of prototype modeling. A better resource for freight car history just doesn't exist, and he was a really nice guy too. Richard was very helpful to me in the creation of this kit. He shared many photos and a great car history which are included in the kit."*

Also new from Yarmouth Model Works are left-hand side ladders for HO scale Rock Island boxcars. Although this

seems to be about as esoteric as a detail part can get, several modelers participating in the annual Cocoa Beach Shake and Take kitbash project actually requested them. They are priced at \$3.00 per fret, which is enough for four cars. Visit their website to order.

N SCALE PRODUCT NEWS

N scale Ready-to-Roll models coming from **Athearn** next June include 40-foot triple-bay

hopper cars with side extensions and a removable wood chip load. Road names will be Norfolk Southern, Missouri Pacific, Bangor & Aroostook, Boston & Maine, Chesapeake & Ohio,

and Chattahoochee Industrial Railroad (item 6582-99). The cars will be sold individually as well as in four-packs with different numbers.

Also coming from Athearn in June

are N scale 65-foot 6-inch mill gondolas decorated for Chicago, Burlington & Quincy; Canadian National; Southern Pacific; Union Pacific; and Penn Central (item 23912-50). For additional information on Athearn products contact a dealer or visit athearn.com.

Atlas Model Railroad Company's new N scale version of a 5077 cu. ft. Plate B boxcar represents one of the 4,300 prototypes FMC

built in their Portland, Oregon plant between 1975 and 1979. The cars were delivered in numerous colorful short line paint schemes, as well as the nationwide car pool fleet of Railbox. In addition to Railbox, road names will be Atlanta & St. Andrews Bay; Atlantic and Western; Burlington Northern; Cadiz Railroad; Escanaba & Lake Superior; Lake Erie, Franklin & Clarion; and Port Huron & Detroit (item 50002403-428).

Additional new N scale models from Atlas include this Trainman series steel cabooses with a centered cupola. The model is based on a prototype

Magor Car Corporation delivered to the Chesapeake & Ohio in

1937. The design proved popular with hundreds of similar cabooses produced by American Car & Foundry and the St. Louis Car Company. Through subsequent rebuilding and modernization, many remained in service until the end of the cabooses era in the 1980s. Atlas' read-to-run model has clear window inserts and separately applied side railings. New road names will be Reading & Northern, Genesee Valley Transportation, Jersey Central, Lehigh Valley, Southern Railway, and Union Pacific. New numbers will be available for Alaska, Canadian National, CP Rail, CSX, and Virginian (item 50002578-597).

During the first quarter of 2016 Atlas plans to release another run of its 53-foot Evans insulated RBL boxcar.

Features on the N scale model include Dreadnaught ends and double Superior plug doors. New road names will be Alaska Railroad; Roscoe, Snyder & Pacific; Brooks Scanlon; Fox River Valley; and States Veneer. Rerun road names with new numbers include Minneapolis, Northfield & Southern; and Bend Millwork Co (item 50002284-299). An undecorated model will also be available. For additional information on all Atlas N scale models visit atlasrr.com/newn.htm.

InterMountain Railway is quoting a February/March 2016 release date for a new

production run of 57-foot class R-70-20 mechanical refrigerator cars. Nine decorating schemes will be available including BNFE (white body), SPFE (white body with blue medallion), SPFE (restenciled), Soo Line, PFE, and UPFE (R-70-25, above). This

ready-to-run N scale model comes with metal wheelsets and working knuckle couplers. The models have an MSRP of \$24.95. An undecorated version will be available at a list price of \$11.50. More info at intermountain-railway.com.

Micro-Trains Line plans to release its SW1500 diesel switcher decorated for BNSF and MKT. The N scale ready-to-run models are expected early next year.

A December date has been announced by Micro-Trains for the release of a set of five heavyweight passenger cars decorated for MOW service. The cars includes a bunk car (ex-sleeper), crew kitchen car (ex-diner), tool and shop cars (ex-baggage cars), and a foreman's office car (ex-observation car). The underframes and trucks of the MOW cars will be weathered.

Micro-Trains is selling a 70-foot Pennsylvania heavyweight

mail-baggage car decorated in Tuscan red with buff lettering and a black roof. The N scale ready-to-run model car comes with PRR type-3D7P2 six-wheel trucks.

A 40-foot double-sheathed wood boxcar decorated for Soo Line will be available about the middle of this month. The N scale ready-to-run model represents a prototype built by American Car & Foundry in 1910. For additional information on all Micro-Trains products, visit their new website at micro-trainsline.com.

Rapido Trains is currently finalizing details on a new N scale 1400-series GMD-1. The model of the modern Canadian locomotive is scheduled for release in October. Reservations close Wednesday, September 30.

In the late 1990s, CN upgraded some GMD-1 1600 locomotives to 1400s with, among other changes, the addition of a 2000-gallon fuel tank and two-axle Flexicoil trucks recycled from retired 1100-series GMD-1 locomotives. These new 1400s, numbered 1430-1444, were classified GR-412b (General Motors Roadswitcher, 4 axles, 1200 hp, group B).

Rapido will produce every number of GR-412b still operational (as of 2014), along with an unnumbered version. Additional upgrades from Rapido's introductory run last year include precisely spaced wheelsets for improved operation on commercial turnouts. The

locomotive model will be available with DCC/Sound and in analog DC with standard directional wiring. This engineering drawing shows how use of the interior space has been maximized.

engineering drawing shows how use of the interior space has been maximized.

In other N scale news from Rapido, work continues on the Osgood Bradley 10-window coach.

Rapido was not happy with the preliminary samples submitted by the tool maker in August 2015. The tooling was deemed not acceptable and was one of the principal reasons Rapido pulled the project and started over with a different tool maker. In the process, the model was completely redesigned. The body shell is now a one-piece casting, including the roof. The batteries for the lighting are still easily accessible, and the gap between the body side and the roof has been eliminated. The Easy-Peasy lighting will now utilize surface-mounted LEDs. The interior detail has also been upgraded. Rapido expects to have decorated samples at the Amherst Show in West Springfield, Massachusetts next January. See rapidotrains.com.

New items coming from **Trainworx** late this year include a series of Peterbilt type-379 long-nose tractors with Caterpillar 3406 engines and a 50-foot Merrit gold-line series livestock trailer. The ready-to-run N scale models will have an MSRP of \$38.95 each. New items coming during the first quarter of 2016 include a pair of FedEx tractors – Peterbilt 379 and Kenworth T800 – and trailers in seven different styles and paint schemes.

Go to train-worx.com/15-8fedex.pdf for details. Also due early next year are Peterbilt type-280 and 350 ‘iron nose’ tractors in eight color combinations. Both tandem- and single-axle tractors will be available. For additional information visit train-worx.com/15-8pete350.pdf.

NEW DECALS, SIGNS AND FINISHING PRODUCTS

Dan Kohlberg has released new HO scale silkscreened decals for Illinois Central and Illinois Central Gulf. The IC decals include 50-foot

PS-1 boxcar with combination doors 1967 + (above), 50-foot PS-1 boxcar with 10-foot door 1968+, and 40-foot PS-1 Hi-Cube boxcar 1967+. The ICG decal set is for a 52-foot black gondola 1981+. Also new is a set of full-color ACI Labels with sufficient material for 36 cars. Photos, prototype information and ordering details are available at home.mindspring.com/~paducah.

Microscale has released new decal sheets that provide lettering for a variety of reefers including Lamb Weston (REMX); Thermice (TICX); Burlington (RBBX); and Kansas, Oklahoma & Gulf (KO&G). Also new is a decal sheet for diesel

locomotives of the Coos Bay Rail Link (CBR). For information on all Microscale products, visit microscale.com. Both sets are available for N and HO scale.

Q Connection has acquired the decal inventory of brass importer Railway Classics The selection includes HO scale decals for Chicago, Burlington & Quincy; Great Northern; Milwaukee Road; New York Central; and other railroads that owned Slumbercoaches. For additional information visit qconnection.biz.

 BRIEFLY NOTED AT PRESS TIME ...

News From The National Train Show

We'll have lots of details and plenty of photos of new products shown at NTS in Portland, Oregon in the next edition of MRH. Meanwhile, here is a quick summary of things that caught our attention last week at the big event.

Accurail is preparing several special kits for release in November at Wisconsin-based Trainfest including an HO kit for a Wisconsin Central P-S 4750 covered grain hopper. The release includes a trio of Milwaukee Road car kits consisting of a 40-foot double-sheathed wood box car, a 40-foot single-sheathed outside braced wood boxcar stenciled for hide loading only, and a 70-ton triple-bay hopper car with offset sides.

American Z showed preliminary samples of a Z scale SD70ACe diesel locomotive, a steel caboose decorated for Santa Fe, and several samples of an impressive Procor Molton Sulfur tank car.

For many attendees, the focal point of **Athearn's** large display booth was the announcement of a new Genesis series HO scale GP39-2 diesel locomotive. The announcement was accompanied by a pre-production sample beautifully decorated for a local favorite: the Portland & Western Railroad. Additional road names will be available on the model which is scheduled for release next August. Other Genesis models on display included a new SD45-2 diesel locomotive and a 1960s-era F89 bi-level open auto rack car. A preview of future HO scale Ready-To-Roll

models included a five-bay rapid discharge hopper with removable coal load, and a 50-foot PS 5277 boxcar for BNSF, C&NW, CSX, and Rail Box, plus Canadian National and Southern in faded paint and patched reporting marks. Also on display was a SD40 diesel with BNSF/CN body details decorated for Central Oregon & Pacific.

Atlas showed their new series of ACF steel express reefers with welded sides. The HO scale model has an arched roof, 3/3 Improved Dreadnaught ends, high-speed trucks and separately applied ladders and grabs. Schemes will include REA, Great Northern, Santa Fe, Seaboard and Transport Arts Corp. Atlas also showed curved HO scale Code 83 turnouts. Atlas O's exhibit showed several impressive new models including triple-unit double-stack well-cars for 48-foot containers; nicely detailed heavyweight passenger cars, and the previously announced California Zephyr dome car.

Bachmann's large booth at NTS displayed a number of items including samples of a new N scale Pennsylvania Railroad 4-6-2 class K4 steam locomotive. Both pre- and post- World War I versions are available now with Bachmann's DCC Sound Value SoundTraxx® steam package at a MSRP of \$399.00. Additional new N scale items scheduled for release next year include a 72-foot heavyweight coaches with interior lights and a GG-1, which will be Bachmann's first N scale electric locomotive. For HO modelers, Bachmann showed a Baldwin 4-6-0 steam locomotive with 52-inch drivers. Also previewed at NTS was an EMD GP38-2, a 2-8-4 Berkshire steam locomotive, an Alco S4 diesel, and several new freight cars. All should be available before Christmas. Due next year is a new EMD E7-A diesel that will be

available with sound as well as DCC ready with an NMRA 8-pin plug. For On30 modelers Bachmann showed a 2-6-0 steam locomotive upgraded with metal gears and sound capability. Also coming for On30 modelers is a selection of Jackson Sharp passenger cars.

BLMA displayed test shots of its forthcoming Trinity 5660 PD covered hopper car. Both N and HO scale versions of the model are scheduled for release next year. Also shown were samples of new searchlight signals and a crude-oil tank car.

Bowser announced plans to produce an HO scale Canadian notched hood version of an SD50F diesel locomotive.

The newest HO scale laser-cut kit from **B.T.S.** is Fire Station No. 1. Details are available at btsrr.com/bts7235.htm. An O scale version of the kit is under development.

ExactRail showed their exquisite waffle-side car in new paint for Grand Trunk Western, and Santa Fe (as delivered in 1974). Additional waffle cars on display in ExactRail's booth were Union Pacific and Detroit Toledo & Ironton cars with new road numbers.

Kato USA displayed preliminary samples of an N scale Siemens/Amtrak ACS-64 Sprinter locomotive along with a new Amfleet I car. Both are scheduled for release next year. Kato showed their new logo-shirts that are currently for sale on their online store at goo.gl/w5m6SP.

Moloco Scale Models **showed preproduction samples of a new** General American Sill 1 10-6 boxcar offset with narrow door rods. Features include steel wire parts on underframe and corner stirrups, Kadee couplers, Kadee running boards, and

Moloco flexible air hoses made of real rubber. Some of the road names have different lettering on the sides and ends. All are priced at \$49.99 each. The stunning model is due to be released in 2016. Multiple road numbers will be available for C&NW, MODX (ART), NKP, NYC, and WADX (ART). Although similar to previous releases, owner Nick Molo assured us this version is entirely new.

North American Railcar had samples of their new 4275 cu. ft. National Steel Car triple-bay potash service covered hopper car. Both HO and N scale versions of this limited edition 2015 Portland NMRA Convention Car are available now. The model replicates Canpotex CNPX No. 150042, a prototype car that is currently in service decorated with the 2015 National NMRA Convention logo. Call 1-866-840-7777 for more information.

Rapido Trains surprised NTS attendees with the announcement of a scale Northern Pacific double-sheathed wood boxcar. Beginning in 1923, more than 4,000 of the prototype cars were built with many lasting until 1970. Details are pending on this ubiquitous car that was seen in operation all across North America. This distinctive car has never been available as an HO scale RTR model. Rapido also showed pre-production samples of an N scale Panorama baggage/express car decorated in a variety of liveries. The head-end car rides on six-wheel Commonwealth trucks with cast pedestals. Additional N scale models in Rapido's booth included beautifully decorated GARX meat reefers. They are being readied for release to dealers within the next 30 days.

Tangent Scale Models introduced an all-new HO scale Pullman-Standard PS-3 coal hopper at the National Train Show. Road names will be Clinchfield (in the "Original FH8" scheme

SEPTEMBER NEWS | 36

from 1958), Great Northern, Louisville & Nashville (in original 1957 Dixie Line scheme), Rock Island, and Utah Railway.

Also available at the show was Tangent's impressive General American three-compartment 6,000 gallon tank car in new paint schemes. They included STCX, GATX (in both early 1940s and later 1948 black schemes), COSX (Mid-Continent Petroleum Company 1929 Cosden & Co. scheme), PDAX, and WCHX (Walter C. Haffner Company). More information is available at tangentscalemodels.com.

Among the few disappointments at the National Train Show was **Walthers** announcement that, due to lack of advanced orders, the entire Fallen Flags series has been cancelled. The cancellation includes all of the Mainline Alco PA-PB diesel locomotives in Walthers 910-20051 to 20062, and 910-10051 to 10062 series, as well as all of the Proto series passenger cars. New items shown by Walthers included HO scale Mainline series EMD SD70ACe locomotives decorated for BNSF, CN, FEC, UP, UP Heritage, CNW, DRGW, and SP. They are due for release in March. Other new items included Walthers newly-tooled Proto series rebuilt Gunderson all-purpose 40' well-car that is due for release in February. Also shown were 80-foot PRR P70fBR coaches coming next summer in four versions: P70 (as built 80-seat, round roof), P70R (ice air conditioning, round roof), P70fBR (clerestory roof, mechanical air conditioning) and P70fBR (round roof, mechanical air conditioning). Walthers large display included some Mainline HO scale 89' Trailer Train channel-side flat cars scheduled for release in January. The flats are designed to handle 28-, 40-, 45- and 48-foot trailers. ■

The Amherst Railway Society Railroad Hobby Show

Our 2016 Show will be

January 30 & 31, 2016

Save the dates!

About The Show

Every year late in January or early in February, the Amherst Railway Society holds its Railroad Hobby Show at the Eastern States Exposition Fairgrounds (The home of The Big E) in West Springfield, Massachusetts. More than 25,000 railfans and public attended the Show each of the past three years.

The event features real life railroads and scale model railroads, historical societies, travel agencies, art shows, flea market dealers, importers, manufacturers and photographers. You have to see it to believe it!

SELECTED EVENTS

September 2015

(Please note that many events charge a fee. Check individual info website for details.)

CANADA, QUEBEC, MONTREAL, September 26-27, Model Train Exposition, at Sun Youth Centre, 4251 St Urbain Street. Info at montrealmodeltrainexposition.com.

ALABAMA, DOTHAN, September 19-20, 25th Wiregrass Model Railroad Show & Sale, sponsored by Wiregrass Steel Wheels of NMRA Dixie Division at National Peanut Festival Fairgrounds, 5622 Highway 231 South. Info at ser-nmra.org.

ARIZONA, SCOTTSDALE, September 16-20, NMRA Pacific Southwest Region Convention, at McCormick Scottsdale Hotel, 7401 North Scottsdale Road. Info at psrnmra.org.

CALIFORNIA, PERRIS, September 12, Fall railroadiansa Swap Meet, at Orange Empire Railway Museum, 2201 South "A" Street. Info at oerm.org/upcoming-events.

GEORGIA, KENNESAW, September 18-19, Atlanta Railroads Prototype Modelers Meet, at the Southern Museum of Civil War and Locomotive History, 2829 Cherokee Street. Jointly presented by SRHA, Atlantic Coast Line & Seaboard Airline Railroads Historical Society, Central of Georgia Railway Historical Society, Louisville and Nashville Historical Society, and Nashville Chattanooga & St. Louis Preservation Society. Info at srha.net.

SELECTED EVENTS | 2

ILLINOIS, BIG ROCK, September 6, Illinois Live Steam & Milwaukee Live Engineers Meet, at Plowman's Park, 48W508 Hinckley Road. Info at facebook.com/PrairieStateRailroadClub.

INDIANA, EDINBURGH, September 12, 15th Annual Train Show & Swap Meet, hosted by Columbus Area Railroad Club, at Johnson County Park. Info at columbusarearailroadclub.com.

INDIANA, INDIANAPOLIS, September 18-19, Annual Convention Show & Sale, hosted by National Association of Timetable Collectors, at Clarion Hotel. Info at naotc.com.

INDIANA, SOUTH BEND, September 11-12, NMRA Michiana Division Education & Training Conference, at Comfort Suites University Arena. Info at michiana-nmra.org/events.

OHIO, MANSFIELD, September 19, Train Show, sponsored by Firelands Society of Model Railroaders, at Richland County Fair Grounds, 750 N. Home Road. Info at fsomr.com/train-show-fliers.html.

MASSACHUSETTS, TAUNTON, September 27, 15th Annual Train Show, sponsored by Old Colony Model Railroad Club, at Taunton Holiday Inn, Route 495 at Exit 9. Info at oldcolonymodelrailroad.tripod.com/train-show.html.

MINNESOTA, ST. PAUL, September 19, Fall Train Show, sponsored by Twin City Model Railroad Museum, at Minnesota State Fairgrounds, Education Building. Info at tcmrm.org/visit/exhibits-events/tcmrm-hobby-show-sale.

MISSOURI, SPRINGFIELD, September 26, Annual Fall Railroad Show, sponsored by Ozark Model Railroad Association, at Remington's, 1655 West Republic Road. Info at [omraspringfield.org/Fall Meet.html](http://omraspringfield.org/Fall_Meet.html).

SELECTED EVENTS | 3

NEBRASKA, NORTH PLATTE, September 18-20, Rail Fest 2015, info at nprailfest.com.

PENNSYLVANIA, YORK, September 25-26, East Coast Train Show, at York Expo Center, 334 Carlisle Avenue. Info at eclsts.com.

TEXAS, HOUSTON, September 2-5, 35th National Narrow Gauge Convention. Info at nngc-2015.com.

VIRGINIA, FREDERICKSBURG, September 25-26, 3rd Annual Mid-Atlantic RPM Meet, at Wingate by Wyndham Fredericksburg, 20 Sanford Drive. Info at marpm.org.

VIRGINIA, VIRGINIA BEACH, September 19-20, Tidewater Division 26th Annual Train Show, at Virginia Beach Convention Center, 1000 19th Street. Info at nmra-mer-tidewater.org.

REVERSE RUNNING

commentary

JOE BRUGGER
.....

[Click here for reader comments](#)

NUKE THE CLUTTER

VERNE NINER HAD A GREAT line in his July “Imagineering” column. One of his steps to moving ahead on a layout is “change or fix what doesn’t work for you.” He said, “Nuke the clutter and restore the railroad room to a pleasant environment.”

Model railroaders have too much stuff. We’re not talking about the stack of GP9s and GP30s. Those will get decoders and be super-detailed someday.

Nor the half dozen SD40s. Nor the boxes of unassembled reefers from Intermountain and Red Caboose.

We’re talking about the stuff that gets in the way, the workbench atop the benchwork that is home to a couple of power drills, boxes of assorted bits, and switch-building jigs. We mean the taped-up cartons of Scout projects, rolls of carpet, boxes of wood scraps, and holiday decorations lingering under the benchwork.

▶ STEPPING OUTSIDE THE BOX WITH A CONTRARY VIEW

Life’s messy, clean it up.

Work on the layout grinds to a halt when you have to shift a pile of household surplus to work on the wiring. Are you really going to find a use for half-a-dozen 5 ¼” disc drives? Don’t kid yourself. Call the kids and ask them to pick up their crystal-growing science project from junior high school. Better yet, have them send their kids over to help you haul boxes to the curb.

Swap meets are a big help. I reduced two banker’s boxes of unneeded books, structures, locomotives, and rolling stock to a pair of Athearn locomotive boxes. That’s probably a 10:1 reduction in volume.

You can install half a dozen switch machines in an afternoon – if there is easy access underneath the benchwork. You can apply static grass, and create a rutted dirt road – as long as tools and parts don’t have to be swept away to reach the work area. Why, you could even spread a drop cloth under the railroad to capture all of the mess that layout and scenery work creates.

Parts you can’t find are not worth having. How many sets of Detail Associates MU receptacles do you have? How many can you lay your hands on in the next five minutes? Hang them on a peg board, or find a plastic bin the right width and depth. Knock together a couple of dividers out of illustration board or styrene to keep them separated.

Hauling away excess stuff leaves you more space to arrange the items you keep. Find a roll-around cart for the tools and give it a solid work top. Add a small vise and power strip to plug in the Dremel or soldering iron. Keep the drills and jig saw in the bottom tray. The tools never have to be left on the benchwork again.

Load up another little cart with scenery supplies – tree-making materials and ground covers proliferate like bunnies, and leave little bits and pieces wherever they go.

The old-timers liked to talk about their “empires.” How much junk is in yours?

DERAILMENTS

1600 TON BRIDGE BUILT IN 4 MIN!

Ok, not really. But, the time-lapse photography is amazing to watch ... It's some great bridge engineering and construction in Reading, UK.

It took over 7 hours to maneuver the 1600-ton concrete and steel structure into place sitting on top of a 66-axle truck!

Learn more about it here:

trainfanatics.com/1600-ton-train-bridge-built-in-4-minutes/?a=lm&var=BridgeBuild-ILT

► BIZARRE FACTS AND HUMOR (SUPPOSEDLY)

"On which side of the platform is my train?" asked a stranger in a Jersey City depot the other day.

"Well, my friend," replied a gentleman, passing, "if you take the left you'll be right; if you take the right you'll be left."

-Weekly Mountaineer, The Dalles, Oregon, January 6, 1877

The introduction of so powerful an agent as steam to a carriage on wheels will make a great change in the situation of man.

-Thomas Jefferson, 1802

In South Dakota, it is illegal to place firecrackers on railroad track. The fine doubles if they are lit.
